NOTE

The designations employed and the presentation of material in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the World Meteorological Organization concerning the legal status of any country, territory, city or area, or of its authorities, or concerning the delimitation of its frontiers or boundaries.

INFOHYDRO Manual

FOREWORD TO THE SECOND EDITION

One of the functions of the World Meteorological Organization is "to promote activities in operational hydrology and to further close cooperation among Meteorological and Hydrological Services of Members". This function is fulfilled largely through the Hydrology and Water Resources Programme (HWRP) of WMO. Promotion of the exchange of information on the status of activities of the Hydrological Services/Agencies of Members is the aim of one of the long-term projects within the Operational Hydrology Programme (OHP-Basic Systems).

The WMO Tenth Congress (1987) welcomed the initiation of the Hydrological Information Referral Service (INFOHYDRO) as an important contribution to the promotion of information exchange. The first edition of the INFOHYDRO Manual was published in 1987.

Clearly, INFOHYDRO can only remain useful if it is continually updated to reflect the extension of hydrological records and changes in political and institutional realities. To this end, the WMO Eleventh Congress (May 1991) urged Members to respond to requests for updated information for INFOHYDRO. Accordingly, by the end of 1993 many Members had provided the Secretariat with updated information.

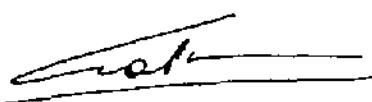

The WMO Commission for Hydrology, at its ninth session (January 1993), recognized that the recent changes in a number of countries would require modifications in Section I — International Organizations Dealing with Hydrology and Water Resources, and in Section II — Principal River and Lake Basins, particularly regarding WMO codes and countries shares in the areas of river basins, as well as on institutional cooperation within these basins. However, these changes are still continuing and, so as not to delay the publication of this second edition, the information given, while not always completely up to date, reflects the situation as close to the present as possible.

Thus, the second edition of the INFOHYDRO Manual contains the most recent information the Secretariat has received from Members. In addition to improvements in the maps of international river basins this edition contains three innovations:

- (a) The addition of a Section VI with information on International Data Banks related to Hydrology and Water Resources;
- (b) The inclusion of two maps for each of the six WMO Regions showing the density of precipitation and discharge stations in countries of the region;
- (c) The translation of the explanatory notes preceding the tables in French, Russian and Spanish.

As proposed by the WMO Commission for Hydrology (1988) and welcomed by the Eleventh Congress (1991), the next step will be the incorporation in INFOHYDRO of a geographical information system (GIS) capability. This has been included as part of Project 3.5.18 of the approved Programme and Budget for 1992–95. It is expected that this capability should assist Members in the application of the new opportunities provided by GIS for network planning and management purposes.

I wish to record my gratitude to all those who have contributed to this important reference publication. Their continued assistance through comments, suggestions and updated information will be most welcome. I trust that Members, international organizations and others involved in hydrology will benefit fully from facilities provided by INFOHYDRO.

(G. O. P. Obasi)
Secretary-General

HYDROLOGICAL INFORMATION REFERRAL SERVICE - INFOHYDRO - INTRODUCTION

PURPOSE AND SCOPE

1. The Hydrological Information Referral Service - INFOHYDRO - is a service for the dissemination of information on:

- (a) National and international (governmental and non-governmental) organizations, institutions and agencies dealing with hydrology;
- (b) Hydrological and related activities of these bodies;
- (c) Principal international river and lake basins of the world;
- (d) Networks of hydrological observing stations of countries - numbers of stations and duration of records;
- (e) National hydrological data banks - status of collection, processing and archiving of data;
- (f) International data banks related to hydrology and water resources.

2. **INFOHYDRO is a metadata base and therefore does not contain or handle actual hydrological data, nor does it duplicate national referral systems.** It is designed to facilitate the prompt dissemination of continually updated hydrological information as listed above to Member countries, particularly for the benefit of their experts, agencies and enterprises engaged in activities or projects related to water-resource assessment, development and management requiring support from national, regional or international agencies dealing with operational hydrology. The information available in INFOHYDRO provides a good indication of water-resources assessment activities of Members. As a computerized service, INFOHYDRO is expected to be developed gradually into an "on-line" system which will be made available to Members and other users.

COMPONENTS AND FUNCTIONS OF INFOHYDRO

3. INFOHYDRO consists of the two components described below.

A. INFOHYDRO Manual

4. The INFOHYDRO Manual contains information concerning the entire INFOHYDRO and its operation. It also contains all hydrological information available at present in INFOHYDRO. Thus, the Manual comprises in a single volume comprehensive information on the Hydrological Services of the countries of the world and their data-collection activities.

5. The Manual is distributed according to WMO procedures for hydrological publications of the Organization supplied to:

- (a) Permanent representatives of Members with WMO or Directors of Meteorological and Hydrometeorological Services of Members;
- (b) Hydrological advisers to permanent representatives, or Hydrological Agencies of Members;
- (c) United Nations and specialized agencies involved in hydrology and water resources;
- (d) International river basin commissions and non-governmental organizations with whom WMO has working agreements.

6. Others users may purchase the Manual from WMO.

B. Computer services

7. INFOHYDRO is maintained as a computerized data base, and data can also be supplied on diskette. Requests should be addressed to:

The Secretary-General
World Meteorological Organization
41, Avenue Giuseppe Motta
P.O. Box 2300
CH-1211 GENEVA 2
Switzerland
Telephone: (+41 22) 730 81 11
Telex: 23 260 OMM CH
Facsimile: (+41 22) 734 23 26

C. Sources of information

8. The information in INFOHYDRO was collected from Members by means of questionnaires, supplemented where appropriate by published information and that available through the UN system. INFOHYDRO was first published in 1977 as Operational Hydrology Report No. 10 - **Statistical Information on Activities in Operational Hydrology** (WMO-No. 464). This publication forms the basis of the INFOHYDRO Manual and the computer service. The computerized information pertaining to each country was reviewed, updated and/or completed by the country concerned.

D. Updating

9. The information stored is updated continually, as new information becomes available through different channels such as WMO experts' reports, missions of Secretariat officers,

WMO Commission for Hydrology and the working groups on hydrology of the WMO regional associations*. However, for purposes of completion, verification and authentification of the updated information, the co-operation of Member countries will be sought at appropriate intervals.

10. However it may not be necessary to update and reprint the entire **INFOHYDRO Manual** because major revisions will tend to pertain to information concerning hydrological observing stations and data banks. Therefore chapters IV, V and VI-Hydrological observing stations, Data banks and International data banks related to hydrology and water resources will require more frequent updating, and will be reissued as necessary.

* The Regional Associations of the World Meteorological Organization established by Congress are as follows:

- Region I - Africa**
- Region II - Asia**
- Region III - South America**
- Region IV - North and Central America**
- Region V - South-West Pacific**
- Region VI - Europe**

SERVICE DE RÉFÉRENCE CONCERNANT L'INFORMATION HYDROLOGIQUE - INFOHYDRO - INTRODUCTION

OBJET ET PORTÉE

1. Le Service de référence concernant l'information hydrologique - INFOHYDRO - est un service de diffusion de données sur :
 - a) les organisations, institutions et organismes nationaux et internationaux (gouvernementaux et non gouvernementaux) qui s'occupent d'hydrologie;
 - b) les activités hydrologiques et apparentées de ces organismes;
 - c) les principaux bassins fluviaux et lacustres internationaux du monde;
 - d) les réseaux nationaux de stations hydrologiques d'observation (nombre de stations et durée des relevés);
 - e) les banques de données hydrologiques nationales (état du rassemblement, du traitement et de l'archivage des données);
 - f) les banques de données internationales concernant l'hydrologie et les ressources en eau.
2. INFOHYDRO est une base globale de données. C'est-à-dire qu'elle ne contient pas de données hydrologiques à proprement parler et ne fait donc pas double emploi avec les systèmes de référence nationaux. Son objet est d'aider à communiquer rapidement des renseignements hydrologiques continuellement actualisés aux pays Membres, en particulier au profit de leurs experts, organismes et entreprises chargés d'activités ou de projets liés à l'évaluation, à la mise en valeur et à la gestion des ressources en eau et nécessitant l'appui d'organismes nationaux, régionaux ou internationaux qui s'occupent d'hydrologie opérationnelle. Les renseignements figurant dans INFOHYDRO donnent une bonne indication des activités d'évaluation des ressources en eau menées par les Membres. En tant que système informatisé, INFOHYDRO devrait être transformé progressivement en un service directement accessible aux pays Membres et autres utilisateurs.

COMPOSANTES ET FONCTIONS DU SYSTÈME INFOHYDRO

3. Le système INFOHYDRO comprend les deux composantes décrites ci-dessous.
 - A. **Manuel INFOHYDRO**
 4. La manuel INFOHYDRO contient des renseignements sur l'ensemble du système et sur son fonctionnement. On y trouve aussi tous les renseignements hydrologiques actuellement disponibles dans ce système. Le manuel regroupe donc en un seul volume des informations complètes sur les services hydrologiques des divers pays et leurs opérations de rassemblement de données.

5. Le manuel est diffusé conformément aux procédures de l'OMM applicables aux publications hydrologiques; il a donc été adressé aux personnes et organismes suivants :

- a) représentants permanents ou directeurs des Services météorologiques et hydrométéorologiques des pays Membres de l'OMM;
- b) conseillers en hydrologie auprès des représentants permanents, ou organismes hydrologiques des pays Membres;
- c) Organisation des Nations Unies (ONU) et institutions spécialisées s'occupant d'hydrologie et de ressources en eau;
- d) commissions des bassins fluviaux internationaux et organisations non gouvernementales avec lesquelles l'OMM a passé des accords de travail.

6. Les autres personnes ou organismes intéressés peuvent acheter le manuel à l'OMM.

B. Service informatisé

7. INFOHYDRO est exploité comme une base de données informatisée, et les données peuvent être communiquées sur disquette. Toute demande de renseignements sera envoyée à l'adresse suivante :

Monsieur le Secrétaire général
Organisation météorologique mondiale
41, avenue Giuseppe Motta
Case postale N° 2300
CH-1211 GENÈVE 2
Suisse

Téléphone : (+41 22) 730 81 11
Télégramme : METEOMOND GENÈVE
Télex : 23 260 OMM CH
Télécopie : (+41 22) 734 23 26

C. Sources d'information

8. Les renseignements figurant dans INFOHYDRO ont été rassemblés auprès des pays Membres, grâce à des questionnaires, et complétés s'il le fallait par des renseignements publiés ou des données disponibles dans le système des Nations Unies. Le premier document du genre a été publié en 1977; il s'agissait du Rapport N° 10 de la série consacrée à l'hydrologie opérationnelle - **Statistical Information on Activities in Operational Hydrology** (Information statistique sur les activités d'hydrologie opérationnelle, OMM - N° 464). Cette publication constitue la base du manuel et du service informatisé INFOHYDRO. Chaque pays a examiné, mis à jour et/ou complété les renseignements informatisés le concernant.

D. Mise à jour

9. Les renseignements en mémoire seront mis à jour en permanence, à mesure que les données nouvelles parviendront à l'OMM par des circuits tels que les rapports d'experts de l'OMM, les missions des responsables du Secrétariat, la Commission d'hydrologie de l'OMM et les groupes de travail de l'hydrologie des associations régionales de l'OMM*. Toutefois, l'OMM demandera aux pays Membres de compléter, de vérifier et d'authentifier les renseignements actualisés, à intervalles appropriés.

10. Toutefois, il ne sera peut-être pas nécessaire de mettre à jour et de rééditer l'ensemble du **Manuel INFOHYDRO** car les principales révisions porteront en général sur des renseignements concernant les stations hydrologiques d'observation et les banques de données. Aussi, les sections IV, V et VI - "Hydrological observing stations" (Stations hydrologiques d'observation), "National hydrological data banks" (Banques de données hydrologiques nationales) et "International data banks related to hydrology and water resources" (Banques de données internationales concernant l'hydrologie et les ressources en eau) - devraient être mises à jour plus fréquemment. Elles seront rééditées selon les besoins.

* Les associations régionales de l'Organisation météorologique mondiale, telles qu'elles ont été établies par le Congrès, sont les suivantes :

- Région I - Afrique
- Région II - Asie
- Région III - Amérique du Sud
- Région IV - Amérique du Nord et Amérique centrale
- Région V - Pacifique Sud-Ouest
- Région VI - Europe

ГИДРОЛОГИЧЕСКАЯ ИНФОРМАЦИОННО-СПРАВОЧНАЯ СЛУЖБА - ИНФОГИДРО - ВВЕДЕНИЕ

ЦЕЛЬ И СФЕРА ПРИМЕНЕНИЯ

- 1.** Гидрологическая информационно-справочная служба - ИНФОГИДРО - является одной из служб по распространению информации о:
 - a) национальных и международных (правительственных и неправительственных) организациях, учреждениях и агентствах, занимающихся гидрологией;
 - b) деятельности органов, упомянутых в пункте (a), в области гидрологии и смежных с нею областях;
 - c) основных международных речных и озерных бассейнах мира;
 - d) сетях гидрологических наблюдательных станций, принадлежащих странам - число станций и длительность наблюдений;
 - e) национальных банках гидрологических данных - состояние сбора, обработки и архивации данных;
 - f) международных банках данных, относящихся к гидрологии и водным ресурсам.
- 2.** ИНФОГИДРО является базой метаданных и, следовательно, не содержит и не занимается фактическими гидрологическими данными и не дублирует национальные справочные системы. Она разработана для облегчения быстрого распространения непрерывно обновляемой гидрологической информации, которая перечислена выше, странам-членам, в частности, в помощь экспертам, агентствам и предприятиям, вовлеченым в деятельность или проекты, относящиеся к оценке, развитию и управлению водными ресурсами, что требует поддержки со стороны национальных, региональных или международных агентств, занимающихся оперативной гидрологией. Информация, имеющаяся в распоряжении ИНФОГИДРО, дает хорошее представление о деятельности членов в области оценки водных ресурсов. Ожидается, что ИНФОГИДРО как служба, основанная на использовании ЭВМ, постепенно превратится в систему, работающую в режиме поступления информации, которая будет доступна членам и другим пользователям.

КОМПОНЕНТЫ И ФУНКЦИИ ИНФОГИДРО

- 3.** ИНФОГИДРО состоит из двух компонентов, описанных ниже.
 - A. Наставление по ИНФОГИДРО**
 - 4.** **Наставление по ИНФОГИДРО** содержит информацию, касающуюся ИНФОГИДРО в целом и ее функционирования. Оно также содержит всю гидрологическую информацию, имеющуюся в настоящее время в распоряжении ИНФОГИДРО. Таким образом, в единственном томе Наставления собрана обширная информация по гидрологическим службам стран мира и их деятельности по сбору данных.
 - 5.** Наставление распространяется в соответствии с практикой ВМО, применяемой в отношении гидрологических публикаций Организации, т.е. оно будет направляться:
 - a) постоянным представителям стран-членов при ВМО или директорам метеорологических и гидрометеорологических служб членов;

- b) советникам по гидрологическим вопросам постоянных представителей или гидрологическим агентствам членов;
- c) Организации Объединенных Наций (ООН) и специализированным агентствам, занимающимся гидрологией и водными ресурсами;
- d) комиссиям по международным речным бассейнам и неправительственным организациям, с которыми ВМО имеет рабочие соглашения.

6. Другие пользователи могут приобретать Поставление у ВМО.

B. Компьютерные услуги

7. ИПФОГИДРО представляет собой компьютеризированную базу данных, при этом данные могут поставляться на дискете. Запросы-заявки следует направлять по адресу:

The Secretary-General
World Meteorological Organisation
41, Avenue Giuseppe Motta
P.O. Box 2300
CH-1211 GENEVA 2
Switzerland
Telephone: (+41 22) 730 81 11
Telex: METEOMOND GENEVE
Telex: 23 260 OMM CH
Facsimile: (+41 22) 734 23 26

C. Источники информации

8. Информация, имеющаяся в распоряжении ИПФОГИДРО, была получена от членов на основе вопросников и дополнена при необходимости опубликованной информацией и той информацией, которая доступна в системе ООН. Эта информация впервые была опубликована в 1977 г. в качестве отчета по оперативной гидрологии № 10 - **Статистическая информация о деятельности в области оперативной гидрологии** (Публикация ВМО № 464). Эта публикация положена в основу **Паставления по ИПФОГИДРО** и компьютерной службы. Введенная в компьютер информация по каждой стране была пересмотрена, обновлена и/или дополнена соответствующей страной.

D. Обновление

9. Информация, хранящаяся в компьютере, дополняется на непрерывной основе по мере поступления новой информации по таким различным каналам, как: отчеты экспертов ВМО, командировки сотрудников Секретариата, Комиссии ВМО по гидрологии и рабочие группы по гидрологии региональных ассоциаций ВМО*. Однако с целью комплектации, проверки и установления подлинности обновленной информации, будет предусмотрено установление сотрудничества стран-членов через соответствующие интервалы времени.

10. Однако надобности в обновлении и перепечатке всего **Паставления по ИПФОГИДРО** может не быть по той причине, что основной пересмотр будет касаться информации, относящейся к гидрологическим наблюдательным станциям и банкам данных. Следовательно, главы IV, V и VI - "Гидрологические наблюдательные станции", "Банки данных" и "Международные банки данных, относящихся к гидрологии и водным ресурсам", потребуют более частого обновления. Они будут переиздаваться по мере необходимости.

* Конгрессом Всемирной Метеорологической Организации учреждены следующие Региональные ассоциации:

Регион I	-	Африка
Регион II	-	Азия
Регион III	-	Южная Америка
Регион IV	-	Северная и Центральная Америка
Регион V	-	Юго-западная часть Тихого океана
Регион VI	-	Европа

SERVICIO DE REFERENCIAS E INFORMACIÓN SOBRE DATOS HIDROLÓGICOS - INFOHYDRO - INTRODUCCIÓN

FINALIDAD Y ALCANCE

1. El Servicio de Referencias e Información sobre Datos Hidrológicos - INFOHYDRO - tiene por cometido difundir información sobre:

- a) organizaciones, instituciones y organismos, nacionales e internacionales (gubernamentales y no gubernamentales) que se ocupan de hidrología;
- b) actividades hidrológicas y conexas de que se ocupan;
- c) principales cuencas fluviales y lacustres internacionales del mundo;
- d) redes de estaciones de observación hidrológica de países - número de las estaciones y duración de los registros;
- e) bancos de datos hidrológicos nacionales - situación de la concentración, proceso y archivo de datos;
- f) bancos de datos internacionales relativos a la hidrología y a los recursos hídricos.

2. El INFOHYDRO es una base de metadatos, por lo que no contiene ni trata datos hidrológicos reales y tampoco se solapa con los sistemas nacionales de referencia. Está destinado a facilitar una pronta difusión de información hidrológica, actualizada de manera permanente, a los países Miembros, en especial a sus expertos, organismos y empresas que se ocupan de actividades o proyectos relacionados con la evaluación, explotación y gestión de recursos hídricos, para los que se requiere apoyo de organismos nacionales, regionales o internacionales que se ocupan de hidrología operativa. La información contenida en el INFOHYDRO proporciona un buen indicio de las actividades de evaluación de recursos hídricos de los Miembros. Como el INFOHYDRO es un servicio automatizado, se espera convertirlo gradualmente en un sistema "en línea", a disposición de los Miembros y de otros usuarios.

COMPONENTES Y FUNCIONES DEL INFOHYDRO

3. El INFOHYDRO consta de los dos componentes que se describen a continuación:

A. Manual del INFOHYDRO

4. El **Manual del INFOHYDRO** contiene información relativa al sistema total del INFOHYDRO y su funcionamiento. También engloba toda la información hidrológica disponible actualmente en el INFOHYDRO. Así pues, el Manual comprende, en un único volumen, información global relativa a los servicios hidrológicos de los países y a sus actividades de concentración de datos.

5. El Manual se distribuye de acuerdo con los procedimientos aplicados por la OMM para la distribución de publicaciones hidrológicas de la Organización, por lo que se suministra a:

- a) los Representantes Permanentes de los Miembros ante la OMM o Directores de los Servicios Meteorológicos e Hidrometeorológicos de los Miembros;
- b) los Asesores hidrológicos de los Representantes Permanentes u organismos hidrológicos de los Miembros;
- c) las Naciones Unidas (NU) y organismos especializados que se ocupan de hidrología y recursos hídricos;
- d) las Comisiones y organizaciones no gubernamentales encargadas de cuencas fluviales internacionales con las que la OMM tiene concertados acuerdos de trabajo.

6. Otros usuarios pueden adquirir el Manual en la OMM.

B. Servicios informatizados

7. El INFOHYDRO se mantiene como base de datos informatizada, pudiendo suministrarse los datos también en disquete. Las peticiones de información deberán cursarse a la siguiente dirección:

El Secretario General
de la Organización Meteorológica Mundial
41, Avenue Giuseppe Motta
P.O. Box 2300
CH-1211 GINEBRA 2, Suiza
Teléfono: (+41 22) 730 81 11
Telegrama: METEOMOND GÉNEVE
Télex: 23 260 OMM CH
Fax: (+41 22) 734 23 26

C. FUENTES DE INFORMACIÓN

8. La información que contiene el INFOHYDRO procede de la que los Miembros aportan por medio de cuestionarios, completada, según corresponda, con información publicada y con la que se proporciona por conducto del sistema de las Naciones Unidas. La información se publicó por primera vez en 1977 en el Informe N° 10 de Hidrología Operativa - **Información estadística sobre actividades de hidrología operativa** (OMM N° 464). Esta publicación constituye la base del Manual del INFOHYDRO y el servicio informatizado. Se ha revisado, actualizado y/o completado por cada uno de los países interesados la información computarizada correspondiente a cada uno de ellos.

D. ACTUALIZACIÓN

9. La información almacenada se actualiza continuamente, a medida que se dispone de nueva información a través de diferentes canales, como informes de expertos de la OMM, misiones de funcionarios de la Secretaría, la Comisión de Hidrología de la OMM y los grupos de trabajo sobre hidrología de las Asociaciones Regionales de la OMM*. Sin embargo, con el fin de completar, verificar y autentificar la información actualizada, se solicitará la cooperación de los países Miembros a intervalos apropiados.

10. No obstante, tal vez no sea necesario actualizar y reimprimir la totalidad del **Manual INFOHYDRO**, ya que las principales revisiones corresponderán a la información relativa a las estaciones de observación hidrológica y los bancos de datos. Por tanto, los Capítulos IV, V y VI - Estaciones de observación hidrológicas, los bancos de datos y los bancos de datos internacionales relativos a hidrología y recursos hídricos habrá que actualizarlos más frecuentemente. Éstos se volverán a publicar en la medida necesaria.

* Las Asociaciones Regionales de la Organización Meteorológica Mundial establecidas por el Congreso son las siguientes:

Región I	- África
Región II	- Asia
Región III	- América del Sur
Región IV	- América del Norte y América Central
Región V	- Suroeste del Pacífico
Región VI	- Europa

I - INTERNATIONAL ORGANIZATIONS DEALING WITH HYDROLOGY AND WATER RESOURCES

TABLES 1.1 to 1.7

Explanatory notes

Tables 1.1 and 1.2: International governmental organizations (IGOs) dealing with hydrology and water resources

These are organizations established by agreements to which two or more States are party. Such organizations may be global or regional. Co-ordination of the activities in hydrology and water resources of the organizations within the United Nations System is achieved through the Sub-Committee on Water Resources of the Administrative Committee on Co-ordination (ACC). The IGOs listed in **Table 1.1** and the United Nations Regional Economic Commissions listed in **Table 1.2** are members of this Sub-Committee. Involvement of these organizations in hydrology and water resources development is delineated in a general way in **Tables 1.3 and 1.4** (see references 1 and 2).

Table 1.3: Involvement of the organizations of the United Nations System in water-resources development: indication of main and applied areas of interest

Column (1) indicates the nature and general interrelationships of the roles played by the organizations in each of these areas.

Column (2) lists the organizations whose main involvement lies in a given area of activity as classified in **Column (1)**.

Column (3) indicates those organizations participating in a given area in the applied sense, such as in the context of comprehensive development planning and/or co-operation with other organizations.

Table 1.4: Involvement of the organizations of the United Nations System in the field of water resources

This table provides a more detailed view of the activities of the organizations. Each cell in the matrix shows which organizations are involved in development and management activities concerning specific water-resources sectors. The development and management functions have been classified as follows:

1. Surface water hydrology
2. Groundwater hydrology
3. Surface water-quality monitoring
4. Groundwater quality monitoring
5. Information on water use
6. Surface water development
7. Groundwater development
8. Waste water re-use
9. Integrated water-resources management
10. Water use management
11. Waste water management

12. Strengthening of institutions
13. Legislation
14. Education and training
15. Human-resources development

The specific water resources sectors are as follows:

- A. Agricultural water use
- B. Drinking-water supply
- C. Industrial water use
- D. Hydropower
- E. Navigation
- F. Flood control
- G. Drought management
- H. Multipurpose water use

Additional information as to the nature of the involvement of each organization, as well as a description of the scope and nature of water-related activities of the organizations of the United Nations System, with examples of typical projects executed by them, is provided in references [3, 4].

Table 1.5: International non-governmental organizations (NGOs) dealing with hydrology and water resources

These are international organizations not established by intergovernmental agreement. They include organizations that accept members designated by government authorities, provided that such membership does not interfere with the free expression of the views of the Organization [1, 2]. The NGOs involved with hydrology and water resources are listed alphabetically in **Table 1.5** in the following categories:

- (a) Federations of international organizations;
- (b) Universal membership organizations;
- (c) Inter-continental membership organizations;
- (d) Regional membership organizations;
- (e) Semi-autonomous bodies; and
- (f) Organizations of special form.

Table 1.5 is presented as follows:

Column (1) - Organization name: the name of the organization is normally given in English.

Column (2) - Acronym

Column (3) - Organization address: the address given is that of the international secretariat, principal secretariat or principal contact as in 1992. Some secretariats rotate or move to another address depending on the changes in the composition of the governing bodies.

Table 1.6: Arrangements for inter-organizational co-operation at the global, regional and sectoral levels

To further their respective roles and enhance the complementarity of their efforts to assist developing countries, the organizations of the United Nations system have formal arrangements for co-operation and collaboration in many programmes, including water. As can be seen from the summaries in **Table 1.6**, some of these arrangements are comprehensive in scope, spanning the entire field of water-resources development, and involving system-wide co-ordination at the global and regional levels. Others are of a sectoral nature and involve bilateral or multilateral collaboration within the framework of a particular aspect of water-resources development. Further details on these arrangements for inter-organizational co-operation are given in [3, 4].

System-wide co-operation in the field of water is facilitated through the UN Administrative Committee on Co-ordination Sub-Committee on Water Resources, constituting an essential focus for collaboration in UN water orientated activities. The IGO's listed in **Table 1.1** and the United Nations Regional Economic Commissions listed in **Table 1.2** are members of this Intersecretarial Group.

Table 1.7: Institutionalized co-operation in international river and lake basins

There are many international agreements and treaties which concern the joint use of international rivers and boundary waters, and many of these agreements and treaties have resulted in institutionalized co-operation among the countries concerned. This table lists the main international institutions of this kind, by WMO Region. The headquarters of each institution and the address of its secretariat, where available or applicable, are also given.

The information for this table is derived from references 5 to 10.

Due to the recent changes in a number of countries, particularly in Europe, updated information on institutional co-operation within international basins shared by some of these countries was not yet available at the time of printing this second edition.

I - ORGANISATIONS INTERNATIONALES S'OCCUPANT D'HYDROLOGIE ET DE RESSOURCES EN EAU

TABLEAUX 1.1 À 1.7

Notes explicatives

Tableaux 1.1 et 1.2 : Organisations internationales gouvernementales s'occupant d'hydrologie et de ressources en eau

Il s'agit d'organisations, mondiales ou régionales, établies par le biais d'accords conclus entre au moins deux Etats. La coordination des activités menées dans le domaine de l'hydrologie et des ressources en eau par les organisations faisant partie du système des Nations Unies est assurée par le Sous-Comité des ressources en eau du Comité administratif de coordination (CAC). Les organisations internationales gouvernementales énumérées au Tableau 1.1 et les commissions économiques régionales des Nations Unies énumérées au Tableau 1.2 sont membres du Sous-Comité. L'engagement de ces organisations dans le domaine de l'hydrologie et de la mise en valeur des ressources en eau est décrit dans ses grandes lignes aux Tableaux 1.3 et 1.4, comme indiqué ci-dessous (voir références 1 et 2).

Tableau 1.3 : Participation d'institutions du système des Nations Unies à la mise en valeur des ressources en eau : principaux domaines d'intérêt et d'intervention

La colonne 1) indique en quoi consiste la participation des institutions dans chacun des domaines cités et spécifie les liens existant entre les institutions dans ces domaines.

La colonne 2) énumère les institutions dont la principale occupation s'inscrit dans le cadre de l'un des domaines d'activité énumérés dans la colonne 1).

La colonne 3) indique les institutions qui participent dans la pratique à un domaine donné, par exemple dans le cadre de projets globaux de mise en valeur et/ou de coopération avec d'autres institutions.

Tableau 1.4 : Participation d'institutions du système des Nations Unies aux activités menées dans le domaine des ressources en eau

Ce tableau fournit une description plus détaillée des activités menées par les institutions. A l'intérieur de chaque colonne sont indiquées les institutions qui participent à des activités de mise en valeur et de gestion pour des secteurs spécifiques des ressources en eau. Les fonctions de mise en valeur et de gestion ont été classées comme suit :

1. Hydrologie (eaux de surface)
2. Hydrologie (eaux souterraines)
3. Surveillance de la qualité des eaux de surface
4. Surveillance de la qualité des eaux souterraines
5. Renseignements sur l'utilisation de l'eau
6. Mise en valeur des ressources en eau de surface
7. Mise en valeur des ressources en eau souterraine
8. Réutilisation des eaux usées
9. Gestion globale des ressources en eau
10. Gestion de l'utilisation de l'eau

11. Gestion de l'utilisation des eaux usées
12. Renforcement des institutions
13. Législation
14. Enseignement et formation professionnelle
15. Mise en valeur des ressources humaines

Les secteurs spécifiques des ressources en eau sont les suivants :

- A. Utilisation de l'eau pour l'agriculture
- B. Alimentation en eau potable
- C. Utilisation de l'eau pour l'industrie
- D. Hydro-électricité
- E. Navigation
- F. Défense contre les inondations
- G. Gestion de la sécheresse
- H. Utilisation de l'eau à des fins multiples

On trouvera dans les références [3, 4] les renseignements supplémentaires sur la nature de la participation de chaque institution, ainsi qu'une description des activités menées par les institutions du système des Nations Unies dans le domaine de l'eau (leur portée et leur nature), illustrée d'exemples de projets types qu'elles ont exécutés.

Tableaux 1.5 : Organisations internationales non gouvernementales (ONG) s'occupant d'hydrologie et de ressources en eau

Il s'agit d'organisations internationales qui n'ont pas été établies par le biais d'un accord intergouvernemental. En font partie les organisations qui acceptent des membres désignés par des administrations gouvernementales, sous réserve que l'adhésion de ces membres ne soit pas un frein à la libre expression des opinions de l'Organisation [1, 2]. Les ONG s'occupant d'hydrologie et de ressources en eau sont énumérées, par ordre alphabétique, au Tableau 1.5. Elles appartiennent à l'une ou l'autre des catégories suivantes :

- a) fédérations d'organisations internationales
- b) organisations dont l'adhésion est universelle;
- c) organisations dont l'adhésion est intercontinentale;
- d) organisations dont l'adhésion est régionale;
- e) organes semi-autonomes; et
- f) organisations de type spécifique.

Le Tableau 1.5 est présenté comme suit :

Colonne 1) - Nom de l'organisation : le nom de l'organisation est indiqué normalement en anglais.

Colonne 2) - Acronyme

Colonne 3) - Adresse de l'organisation : l'adresse indiquée est celle du secrétariat international ou du secrétariat principal, ou encore celle du principal centre de liaison, pour 1992. Certains secrétariats assurent leurs fonctions à tour de rôle ou changent d'adresse selon les changements intervenus dans la composition des organes directeurs.

Tableau 1.6 : Dispositions prises par les organisations en vue de leur collaboration dans la mise en valeur des ressources en eau, pour l'ensemble des systèmes (mondiaux ou régionaux) et des secteurs (collaboration bilatérale ou multilatérale)

Afin d'améliorer leurs rôles respectifs et de favoriser la complémentarité des efforts qu'elles déplient pour aider les pays en développement, les institutions du système des Nations Unies prennent des dispositions officielles de coopération et de collaboration dans de nombreux programmes, y compris dans les programmes relatifs à l'eau. Comme le montrent les résumés figurant au Tableau 1.6, certaines de ces dispositions ont une portée très étendue, dans la mesure où elles couvrent l'ensemble de la question de la mise en valeur des ressources en eau et englobent une coordination de toute le système, à l'échelle aussi bien mondiale que régionale. D'autres, plus sectorielles, portent sur une collaboration bilatérale ou multilatérale s'effectuant dans le cadre d'un aspect spécifique de la mise en valeur des ressources en eau. On trouvera aux références [3, 4] plus de détails sur ces dispositions de coopération entre institutions.

La coopération dans le domaine de l'eau est facilitée par le Sous-Comité des ressources en eau, du Comité administratif de coordination des Nations Unies, qui constitue un axe essentiel de collaboration des activités menées par les Nations Unies dans ce domaine. Les organisations intergouvernementales énumérées au Tableau 1.1 et les commissions économiques régionales des Nations Unies énumérées au Tableau 1.2, sont membres de ce Sous-Comité.

Tableau 1.7 : Coopération institutionnalisée dans les bassins fluviaux et lacustres internationaux

Il existe beaucoup d'accords et de traités internationaux concernant l'utilisation commune de fleuves internationaux et d'eaux limitrophes. Bon nombre d'entre eux ont donné lieu à une coopération institutionnalisée entre les pays concernés. Ce tableau énumère les principales institutions internationales de ce type, classées par Région de l'OMM. Le Siège de chaque institution et l'adresse de son secrétariat sont également indiqués, le cas échéant.

Les renseignements fournis dans ce tableau sont tirés des références 5 à 10.

En raison des changements récents survenus dans un certain nombre de pays, en particulier en Europe, la version actualisée des renseignements concernant la coopération institutionnelle à l'intérieur des bassins internationaux que certains de ces pays se partagent n'était pas encore disponible au moment où cette deuxième édition était imprimée.

I - МЕЖДУНАРОДНЫЕ ОРГАНИЗАЦИИ, ЗАНИМАЮЩИЕСЯ ГИДРОЛОГИЕЙ И ВОДНЫМИ РЕСУРСАМИ

ТАБЛИЦЫ 1.1 - 1.7

Пояснительные записки

Таблицы 1.1 и 1.2: Международные правительственные организации (МПО), занимающиеся гидрологией и водными ресурсами.

Это организации, учрежденные на основе соглашений, сторонами которых являются две или более страны. Эти организации могут быть как глобальными, так и региональными. Деятельность в области гидрологии и водных ресурсов организаций, входящих в систему Организации Объединенных Наций, координируется подкомитетом по водным ресурсам Административного комитета ООН по координации (АКК). МПО, перечисленные в таблице 1.1 и региональные экономические комиссии Организации Объединенных Наций, перечисленные в таблице 1.2, являются членами этого подкомитета. Участие этих организаций в гидрологической деятельности и освоении водных ресурсов описано в общих чертах в таблицах 1.3 и 1.4 в изложенном ниже порядке (см. ссылки 1 и 2).

Таблица 1.3: Участие организаций системы Организации Объединенных Наций в освоении водных ресурсов: указатель основных и прикладных сфер, представляющих интерес

Колонка (1) дает представление о характере и общей взаимосвязи деятельности организаций в каждой из этих сфер.

Колонка (2) содержит список организаций, играющих основную роль в конкретной сфере деятельности, описанной в *колонке (1)*.

Колонка (3) дает представление о тех организациях, которые заняты в конкретной сфере в прикладном плане, в частности, в контексте всеобъемлющего планирования процесса развития и/или сотрудничества с другими организациями.

Таблица 1.4: Деятельность организаций системы Организации Объединенных Наций в области освоения водных ресурсов

Данная таблица содержит более подробное описание деятельности организаций. В каждой отдельной графе указано, какие организации участвуют в деятельности по развитию и управлению конкретными секторами водных ресурсов. Задачи по освоению и управлению классифицированы следующим образом:

1. Гидрология поверхностных вод
2. Гидрология подземных вод
3. Мониторинг качества поверхностных вод
4. Мониторинг качества подземных вод
5. Информация по водопользованию
6. Освоение поверхностных вод
7. Освоение подземных вод
8. Повторное использование сточных вод
9. Комплексное управление водными ресурсами
10. Управление водопользованием

11. Управление сточными водами
12. Укрепление организационной структуры
13. Законодательство
14. Образование и подготовка кадров
15. Развитие людских ресурсов

К числу конкретных секторов водных ресурсов относятся следующие:

- A. Использование сельскохозяйственных вод
- B. Снабжение питьевой водой
- C. Использование промышленных вод
- D. Гидроэнергия
- E. Судоходство
- F. Регулирование наводков
- G. Управление засухой
- H. Многоцелевое использование водных ресурсов

В ссылках [3, 4] содержится дополнительная информация о характере участия каждой организации, а также описание сферы охвата и характера водохозяйственной деятельности организаций системы Организации Объединенных Наций наряду с примерами типовых проектов, которые были осуществлены ими.

Таблица 1.5: Международные неправительственные организации (МНО), занимающиеся гидрологией и водными ресурсами

К числу этих организаций относятся те, которые были созданы не на основе межправительственных соглашений. Они включают организации, принимающие в свой состав членов, назначаемых государственными властями при условии, что это членство не препятствует свободному выражению мнений Организации [1, 2]. В таблице 1.5 перечислены в алфавитном порядке МНО, занимающиеся гидрологией и водными ресурсами. Их можно отнести к одной из следующих категорий:

- a) федерации международных организаций;
- b) всемирные организации;
- c) межконтинентальные организации;
- d) региональные организации;
- e) полуавтономные организации;
- f) специальные организации.

В таблице 1.5 содержится следующее:

Колонка (1) - название организации: название организации обычно дается на английском языке.

Колонка (2) - сокращение

Колонка (3) - адрес организации: указывается адрес международного секретариата, либо главного секретариата, либо основного пункта связи по состоянию на 1992 г. Некоторые секретариаты переезжают либо меняют свой адрес в связи с изменениями в составе руководящих органов.

Таблица 1.6: Меры по межорганизационному сотрудничеству на глобальном, региональном и секторальном уровнях

Организации системы Организации Объединенных Наций имеют официальные соглашения по сотрудничеству в рамках многих программ, включая водные ресурсы, в целях содействия осуществлению их соответствующей роли и активизации их дополнительных усилий в деле оказания помощи развивающимся странам. Данные, содержащиеся в таблице I.6, свидетельствуют о том, что некоторые из этих соглашений являются всеобъемлющими по сфере применения и охватывают всю область освоения водных ресурсов, а также включают элементы общесистемной координации на глобальном и региональном уровнях. Другие же носят секторальный характер и охватывают сферу двустороннего или многостороннего сотрудничества в рамках конкретного аспекта освоения водных ресурсов. Дополнительные сведения относительно этих соглашений по межорганизационному сотрудничеству содержатся в [3, 4].

Общесистемное сотрудничество в области водных ресурсов налаживается через подкомитет по водным ресурсам Административного комитета ООН по координации, являющийся важным центром сотрудничества по осуществлению деятельности ООН в области водных ресурсов. МПО, перечисленные в таблице 1.1, и региональные экономические комиссии ООН, перечисленные в таблице 1.2, являются членами этой межсекретариатской группы.

Таблица 1.7: Сотрудничество, учрежденное в области международных речных и озерных бассейнов

Существует множество международных соглашений и договоров, касающихся совместного использования международных рек и пограничных вод, причем многие из этих соглашений и договоров способствовали развитию сотрудничества, учреденного между заинтересованными странами. В этой таблице перечислены основные международные организации такого рода по регионам ВМО. Кроме того, при наличии или в соответствующих случаях, указывается штаб-квартира каждой организации и адрес ее секретариата.

Информация для этой таблицы подготовлена на основе ссылок 5-10.

В связи с последними изменениями в ряде стран, особенно в Европе, обновленная информация по сотрудничеству, учрежденному в области международных бассейнов, между некоторыми из этих стран, не поступила к моменту публикации данного второго издания.

I - ORGANIZACIONES INTERNACIONALES GUBERNAMENTALES QUE SE OCUPAN DE HIDROLOGÍA Y DE RECURSOS HÍDRICOS

CUADROS 1.1 a 1.7

Notas explicativas

Cuadros 1.1 y 1.2: Organizaciones internacionales gubernamentales (OIG) que se ocupan de hidrología y de recursos hídricos

Se trata de organizaciones establecidas por acuerdos de que son parte dos o más Estados. Tales organizaciones pueden ser mundiales o regionales. La coordinación de las actividades de hidrología y recursos hídricos de las organizaciones del sistema de las Naciones Unidas se logra a través del Subcomité de Recursos Hídricos del Comité Administrativo de Coordinación (CAC). Las OIG enumeradas en el Cuadro 1.1 y las Comisiones Económicas Regionales de las Naciones Unidas enumeradas en el Cuadro 1.2 son miembros de este Subcomité. La intervención de esas organizaciones en el desarrollo de la hidrología y de los recursos hídricos se describe con carácter general en los Cuadros 1.3 y 1.4, según se explica a continuación (véanse las referencias 1 y 2).

Cuadro 1.3: Intervención de las organizaciones del sistema de las Naciones Unidas en el desarrollo de recursos hídricos: indicación de las esferas principales y aplicadas de interés

La Columna (1) indica la naturaleza y la interrelación general de las funciones desempeñadas por las organizaciones en cada una de estas esferas.

En la Columna (2) se enumeran las organizaciones cuya principal intervención tiene lugar en determinada esfera de actividad, según se clasifica en la columna (1).

La Columna (3) indica las organizaciones que participan en determinada esfera en el sentido aplicado, como en el contexto de la planificación y/o la cooperación con otras organizaciones para el desarrollo global.

Cuadro 1.4: Intervención de las organizaciones del sistema de las Naciones Unidas en materia de recursos hídricos

Este cuadro da una idea más detallada de las actividades de las organizaciones. Cada célula de la matriz muestra qué organizaciones intervienen en las actividades de desarrollo y gestión relativas a sectores de recursos hídricos concretos. Las funciones de desarrollo y gestión se han clasificado como sigue:

1. Hidrología de agua de superficie
2. Hidrología de agua subterránea
3. Control de calidad del agua de superficie
4. Control de calidad del agua subterránea
5. Información sobre utilización del agua
6. Aprovechamiento del agua de superficie
7. Aprovechamiento del agua subterránea
8. Reutilización de aguas residuales
9. Gestión integrada de recursos hídricos
10. Gestión de utilización del agua
11. Gestión de aguas residuales
12. Fortalecimiento de instituciones
13. Legislación
14. Enseñanza y formación profesional
15. Desarrollo de recursos humanos

Los sectores de recursos hídricos concretos son los siguientes:

- A. Utilización del agua para la agricultura
- B. Abastecimiento de agua potable
- C. Utilización de agua para la industria
- D. Energía hidroeléctrica
- E. Navegación
- F. Control de las crecidas
- G. Gestión de las sequías
- H. Utilización del agua con fines múltiples

En las referencias [3, 4] figura información adicional en cuanto a la naturaleza de la intervención de cada organización, así como una descripción del alcance y la naturaleza de las actividades relacionadas con el agua de las organizaciones del sistema de las Naciones Unidas, con ejemplos de proyectos típicos ejecutados por ellas.

Cuadro 1.5: Organizaciones internacionales no gubernamentales (ONG) que se ocupan de hidrología y de recursos hídricos

Se trata de organizaciones internacionales no establecidas por acuerdo intergubernamental. Comprenden organizaciones que aceptan a miembros designados por autoridades gubernamentales, siempre y cuando ello no interfiera en la libre expresión de las opiniones de la Organización [1, 2]. Las ONG que se ocupan de hidrología y recursos hídricos se enumeran por orden alfabético en el Cuadro 1.5. Pueden pertenecer a cualquiera de las categorías siguientes:

- a) federaciones de organizaciones internacionales;
- b) organizaciones de composición universal;
- c) organizaciones de composición intercontinental;
- d) organizaciones de composición regional;
- e) órganos semiautónomos, y
- f) organizaciones de forma especial.

El Cuadro 1.5 se presenta como sigue:

Columna (1) - Nombre de la organización: el nombre de la organización figura normalmente en inglés.

Columna (2) - Acrónimo

Columna (3) - Dirección de la organización: la dirección indicada es la de la secretaría internacional o la secretaría principal o el principal contacto, como en 1992. Algunas secretarías rotan o cambian de dirección, según la modificación de la composición de los órganos de gobierno.

Cuadro 1.6: Acuerdos de cooperación a nivel del sistema (mundial, regional) y sectorial (bilateral o multilateral) para el desarrollo de recursos hídricos

Con el fin de fomentar sus respectivas funciones y de mejorar la complementariedad de sus esfuerzos para ayudar a los países en desarrollo, las organizaciones del sistema de las Naciones Unidas tienen acuerdos formales de cooperación y colaboración en numerosos programas, incluido el del agua. Como puede verse por los resúmenes del Cuadro 1.6, algunos de esos acuerdos son exhaustivos, abarcando la totalidad del desarrollo de los recursos hídricos y englobando la

coordinación en todo el sistema a nivel mundial y regional. Otros tienen carácter sectorial y abarcan la coordinación bilateral o multilateral en el marco de determinado aspecto del desarrollo de los recursos hídricos. En [3, 4] figuran más detalles sobre tales acuerdos de cooperación entre organizaciones.

La cooperación a nivel del sistema por lo que se refiere al agua se facilita a través del Subcomité de Recursos Hídricos del Comité Administrativo de Coordinación de las Naciones Unidas, que constituye una parte esencial de la colaboración en las actividades relacionadas con el agua en las Naciones Unidas. Las OIG enumeradas en el Cuadro 1.1 y las Comisiones Económicas Regionales de las Naciones Unidas enumeradas en el Cuadro 1.2 son miembros de este Grupo Intersecretarías.

Cuadro 1.7: Cooperación institucionalizada en cuencas fluviales y lacustres internacionales

Hay numerosos acuerdos y tratados internacionales sobre la utilización conjunta de las aguas fluviales limítrofes internacionales, y muchos de estos acuerdos y tratados han dado lugar a una cooperación institucionalizada entre los países interesados. En este cuadro se enumeran las principales instituciones internacionales de este tipo, por Regiones de la OMM. También se indica la sede de cada institución y la dirección de su secretaría, cuando se dispone de ella o es aplicable.

La información para confeccionar este cuadro se ha obtenido de las referencias 5 a 10.

Debido a recientes cambios en varios países, sobre todo en Europa, en el momento de imprimirse esta segunda edición no se disponía aún de información actualizada sobre la cooperación institucional en las cuencas internacionales compartidas por algunos de esos países.

II - PRINCIPAL RIVER AND LAKE BASINS

TABLES 2.1 to 2.6

Explanatory notes

Tables 2.1 to 2.6 list principal river basins and groups of basins according to WMO Regions. Within each table the basins are listed in order of basin number.

An international system of hydrological observing station identification numbers has been adopted by WMO. Further information on this system may be found in the WMO **Manual on Codes**, (WMO - No. 306) Volumes I (1984) and II (1987) and in FM 67-VI HYDRA - Report of hydrological observations from a hydrological station and FM 68-VI HYFOR - Hydrological forecast.

The six columns within each table contain the following information:

- (1) *Name of the basin or group of basins.*
- (2) *Basin area.*
- (3) *Basin code (by which the basin listing is ordered) [BB].*
- (4) *Name of the State/Territory.*
- (5) *Percentage of the basin within each State/Territory.*
- (6) *The country code [C_i].*

Each table is followed by a map of the WMO Region showing the international river basins.

The listing of countries for the basins does not imply that these countries are engaged in co-operative action in respect of the basin.

Due to recent boundary changes in a number of countries, particularly in Europe, updated information on WMO codes and the decision of international river basins between countries, as well as on the frontiers on the maps of the WMO Regions, were not yet available at the time of printing this second edition.

II - PRINCIPAUX BASSINS FLUVIAUX ET LACUSTRES

TABLEAUX 2.1 à 2.6

Notes explicatives

Les tableaux 2.1 à 2.6 énumèrent les principaux bassins fluviaux et groupes de bassins, classés par Région de l'OMM. A l'intérieur de chaque tableau, les bassins sont énumérés par ordre de numéro de bassins.

L'OMM a adopté un système international de numéros d'identification des stations d'observation hydrologique. Pour plus d'informations sur ce système, il convient de se référer au **Manuel des codes** de l'OMM (OMM-N° 306), Volume I (1984) et II (1987), ainsi qu'aux messages FM 67-VI HYDRA - Message d'observation hydrologique provenant d'une station d'observation hydrologique - et FM 68-VI HYFOR - Prévision hydrologique.

Les six colonnes composant chacun des tableaux contiennent les renseignements suivants :

- 1) Nom du bassin ou du groupe de bassins
- 2) Zone couverte par le bassin
- 3) Code du bassin (numéro de classement du bassin) [BB]
- 4) Nom de l'Etat ou du Territoire
- 5) Pourcentage de la zone couverte par le bassin à l'intérieur de chaque Etat/Territoire
- 6) Code du pays [Ci].

Chaque tableau est suivi d'une carte de la Région de l'OMM représentant les bassins fluviaux internationaux.

L'énumération des pays auxquels correspondent les bassins n'implique nullement que ces pays sont engagés dans un effort de coopération concernant ces bassins.

En raison des changements récents survenus dans un certain nombre de pays, en particulier en Europe, la version actualisée des renseignements concernant les codes de l'OMM et le partage entre pays des zones de bassins fluviaux internationaux, ainsi que les frontières dressées sur les cartes des Régions de l'OMM, n'était pas encore disponible au moment où cette deuxième édition était imprimée.

II - ОСНОВНЫЕ РЕЧНЫЕ И ОЗЕРНЫЕ БАССЕЙНЫ

ТАБЛИЦЫ 2.1-2.6

Пояснительные записки

В таблицах 2.1-2.6 перечисляются основные речные бассейны и группы бассейнов в соответствии с разделением на Регионы ВМО. В каждой таблице бассейны перечисляются в порядке следования номеров.

ВМО утвердила международную систему идентификационных номеров гидрологических наблюдательных станций. Дополнительная информация об этой системе содержится в **Приложении ВМО по кодам** (Публикация ВМО № 306), том I (1984 г.) и том II (1987 г.), а также в FM 67-VI HYDRA - Отчет о гидрологических наблюдениях гидрологических站ий и в FM 68-VI HYFOR - Гидрологический прогноз.

Шесть колонок каждой таблицы содержат следующую информацию:

- 1) название бассейна или группы бассейнов;
- 2) площадь бассейна;
- 3) код бассейна (в порядке следования номеров) [BB];
- 4) название страны/территории;
- 5) процентная доля площади бассейна в рамках каждой страны/территории;
- 6) код страны [C_i].

Каждая таблица сопровождается картой Региона ВМО, на которой показаны международные речные бассейны.

Отнесение тех или иных стран к конкретному бассейну не означает, что эти страны проводят совместные мероприятия в отношении данного бассейна.

В связи с недавними изменениями в ряде стран, особенно в Европе, к моменту опубликования настоящего второго издания не было получено последней информации о кодах ВМО и доле стран в рамках территорий международных речных бассейнов, а также границах, указанных на картах Регионов ВМО

II - PRINCIPALES CUENCAS FLUVIALES Y LACUSTRES

CUADROS 2.1 a 2.6

Notas explicativas

En los **Cuadros 2.1 a 2.6** se enumeran las principales cuencas y grupos de cuencas fluviales según las Regiones de la OMM. En cada uno de los cuadros, las cuencas se enumeran por orden del número de cuenca.

La OMM ha adoptado un sistema internacional de números de identificación de estaciones de observación hidrológicas. En el **Manual de Claves** (OMM - Nº 306), Volúmenes I (1984) y II (1987) y en FM 67-VI HYDRA - Informe de observación hidrológica proveniente de una estación de observación hidrológica, y FM 68-VI HYFOR - Pronóstico hidrológico, puede hallarse más información sobre este sistema.

Las seis columnas de cada cuadro contienen la siguiente información:

- 1) **Nombre de la cuenca o del grupo de cuencas.**
- 2) **Área de la cuenca.**
- 3) **Código de la cuenca (según el cual se ordena la enumeración de las cuencas) [BB].**
- 4) **Nombre del Estado/Territorio.**
- 5) **Porcentaje de la cuenca en cada Estado/Territorio.**
- 6) **Clave del país [Cj].**

Cada cuadro va seguido de un mapa de la Región de la OMM en el que se muestran las cuencas fluviales internacionales.

La enumeración de los países para las cuencas no implica que esos países intervengan en actividades de cooperación con respecto a la cuenca.

Debido a recientes cambios en varios países, sobre todo en Europa, en el momento de imprimirse esta segunda edición no se disponía aún de información actualizada sobre claves de la OMM y partes de países en las zonas de cuencas fluviales internacionales, ni sobre las fronteras trazadas en los mapas de las Regiones de la OMM.

III - NATIONAL AGENCIES DEALING WITH HYDROLOGY AND WATER RESOURCES

TABLES 3.1 to 3.9

Explanatory Notes

The national Hydrological Services or Agencies of WMO Members are listed in six tables (**Tables 3.1 to 3.6**), one for each of the six WMO Regions. Explanation of the symbols used in these tables is given below in the order of the column titles:

Column (1) - State or Territory:

- Type of inter-Agency co-ordination
- Name and address of Agency
- Responsible authority (ministry)

This column lists, under the name of each WMO Member, the national Agencies dealing with operational hydrology and water resources, together with their addresses and the authority or ministry to which each Agency reports. Information on the inter-Agency co-ordination is also provided, which may be of the following types:

- All services are combined (one Agency only);
- Co-ordination is carried out by one of the Agencies listed (Agency number is indicated);
- Co-ordination is carried out by a separate national Agency;
- Co-ordination is *ad hoc*, when needed;
- Other.

Column (2) - Main activities of Agency: The letters used in the table indicate the activities as follows:

- | | |
|---|----------------------------|
| G | - General hydrology |
| H | - Hydropower production |
| A | - Agriculture (irrigation) |
| W | - Water supply |
| F | - Flood control |
| P | - Pollution control |
| N | - Navigation |
| T | - Other |

Column (3) - Level (of activity):

- | | |
|---|---------------------------|
| N | - National |
| R | - Regional (sub-national) |

Column (4) - Hydrological stations: the sub-column headings A to K indicate the types of networks operated by each agency as follows:

- A - Hydrometric observations
- B - Groundwater observations
- C - Climatological observations for hydrological purposes
- D - Snow
- E - Lakes (stage)
- F - Glaciers (advance and retreat)
- G - Estuaries
- H - Ice thickness in fresh water bodies
- I - Soil moisture
- J - Sediment discharge
- K - Water quality (physical and chemical)

The involvement of the Agency in operating these networks in the country is shown by the numbers 1, 2 and 3 as follows:

- 1 - The Agency mainly responsible for these networks in the country;
- 2 - An Agency with secondary involvement;
- 3 - Other Agency (ies) operating these networks.

Column (5) - Yearbooks or summaries, and Column (6) - Data catalogues: both these columns are coded as for Column (4) (Hydrological stations) but only for categories A - Hydrometric observations, B - Groundwater observations and C - Climatological observations for hydrological purposes.

Tables 3.7 to 3.9 provide summaries, by WMO Region, respectively, of: national Hydrological Agencies; operation of hydrological networks; and activities of national Agencies.

III - ORGANISMES NATIONAUX S'OCCUPANT DE L'HYDROLOGIE ET DE LA MISE EN VALEUR DES RESSOURCES EN EAU

TABLEAUX 3.1 à 3.9

Notes explicatives

Les services ou organismes hydrologiques nationaux des Membres de l'OMM font l'objet de six tableaux (**tableaux 3.1 - 3.6**), qui correspondent chacun à l'une des six Régions de l'OMM. On trouvera ci-après, dans l'ordre des titres de colonne, l'explication des symboles utilisés dans ces tableaux.

Colonne (1) - Etat ou territoire :

- Type de coordination interinstitutions
- Nom et adresse de l'organisme
- Autorité responsable (ministère)

Dans cette colonne sont indiqués, sous le nom de chaque Membre de l'OMM, les organismes nationaux qui s'occupent de l'hydrologie opérationnelle et de la mise en valeur des ressources en eau, ainsi que leurs adresses et l'autorité ou le Ministère dont ils relèvent. Y sont également fournies des informations sur le type de coordination interinstitutions :

- Tous les services sont regroupés (en un seul organisme)
- La coordination est assurée par l'un des organismes énumérés (le numéro de l'organisme est indiqué)
- La coordination est assurée par un organisme national distinct
- La coordination est assurée selon les besoins
- Autres types de coordination

Colone (2) - Principales activités de l'organisme : Les lettres utilisées dans le tableau indiquent les activités comme suit :

G	-	Hydrologie générale
H	-	Production d'énergie hydroélectrique
A	-	Agriculture (irrigation)
W	-	Approvisionnement en eau
F	-	Maîtrise des crues
P	-	Lutte contre la pollution
N	-	Navigation
T	-	Divers

Colonne (3) - Niveau (d'activité) :

N	-	National
R	-	Régional

Colonne (4) - Stations hydrologiques : Les en-têtes des colonnes A à K indiquent le type de réseau exploité par chaque organisme, comme suit :

- A - Observations hydrométriques
- B - Observations concernant les eaux souterraines
- C - Observations climatologiques à des fins hydrologiques
- D - Neige
- E - Lacs (hauteur d'eau)
- F - Glaciers (avance et retrait)
- G - Estuaires
- H - Epaisseur de la glace dans les masses d'eau douce
- I - Humidité du sol
- J - Débit solide
- K - Qualité de l'eau (physique et chimique)

La participation de l'organisme à l'exploitation des réseaux en question dans le pays concerné est indiquée par les chiffres 1, 2 et 3, dont la signification est la suivante :

- 1 - Principal organisme responsable de ces réseaux dans les pays
- 2 - Organisme jouant un rôle secondaire
- 3 - Autre(s) organisme(s) exploitant ces réseaux

Colonne (5) - Annuaires ou résumés, et colonne (6) - Catalogues de données : Dans ces deux colonnes on utilise les mêmes codes que dans la **colonne (4) (Stations hydrologiques)**, mais uniquement pour les catégories A (observations hydrométriques), B (observations concernant les eaux souterraines) et C (observations climatologiques à des fins hydrologiques).

Les tableaux 3.7 à 3.9 sont des états récapitulatifs qui indiquent, par Région de l'OMM, des chiffres concernant respectivement : les organismes hydrologiques nationaux; l'exploitation des réseaux hydrologiques et les activités des organismes nationaux.

III - НАЦИОНАЛЬНЫЕ АГЕНТСТВА, СВЯЗАННЫЕ С ГИДРОЛОГИЕЙ И ВОДНЫМИ РЕСУРСАМИ

ТАБЛИЦЫ 3.1-3.9

Пояснительные записки

Национальные гидрологические службы или агентства членов ВМО перечислены в шести таблицах (таблицы 3.1-3.6) по одной для каждого из шести Регионов ВМО. Пояснения символов, использованных в этих таблицах, приводятся ниже в порядке заголовков колонок:

Колонка (1) - Государство или территория:

- Тип межагентской координации
- Название и адрес агентства
- Власти, несущие ответственность (министрство)

В данной колонке под названием каждого члена ВМО перечисляются национальные агентства, связанные с оперативной гидрологией и водными ресурсами, с указанием их адресов и властей или министерства, которому подотчетно каждое агентство. Также предоставляется информация о межагентской координации, которая может быть следующих типов:

- Все обслуживание объединено (только одно агентство)
- Координация осуществляется одним из перечисленных агентств (номер агентства указывается)
- Координация осуществляется отдельным национальным агентством
- Координация осуществляется на специальной основе, по мере необходимости
- Другие виды координации

Колонка (2) - Основные виды деятельности агентства: для указания видов деятельности в таблице используются следующие буквы:

G	-	Общая гидрология
H	-	Производство электроэнергии
A	-	Сельское хозяйство (ирригация)
W	-	Водоснабжение
F	-	Управление паводками
P	-	Контроль загрязнения
N	-	Навигация
T	-	Другие виды деятельности

Колонка (3) - Уровень (деятельности):

N	-	Национальный
R	-	Районный, областной (по внутринациональному делению)

Колонка (4) - Гидрологические станции: в заголовках подколонок буквами от А до К указываются следующие типы сетей, эксплуатируемых каждым агентством:

A	-	Гидрометрические наблюдения
B	-	Наблюдения за подземными водами
C	-	Климатологические наблюдения для гидрологических целей
D	-	Снег

- E - Озера (уровень)
- F - Ледники (наступление и отступление)
- G - Эстуарии
- H - Толщина льда в пресноводных объектах
- I - Почвенная влага
- J - Расход наносов
- K - Качество воды (физическое и химическое)

Участие агентства в эксплуатации этих сетей в стране указывается с помощью цифр 1, 2 и 3 следующим образом:

- 1 - Агентство, в основном ответственное за эти сети в стране
- 2 - Агентство со вспомогательными функциями
- 3 - Другое(ие) агентство(а), эксплуатирующее(ис) эти сети

Колонка (5) - Ежегодники или резюме и колонка (6) - Каталоги данных обе эти колонки кодируются как и колонка (4) (Гидрологические станции), но только для категорий: А - Гидрометрические наблюдения; В - Наблюдения за подземными водами; и С - Климатологические наблюдения для гидрологических целей.

В таблицах 3.7-3.9 предоставляются резюме по регионам ВМО, соответственно касающиеся: национальных гидрологических агентств; функционирования гидрологических сетей; а также деятельности национальных агентств.

III - ORGANISMOS NACIONALES QUE SE OCUPAN DE HIDROLOGIA Y RECURSOS HIDRICOS

CUADROS 3.1 a 3.9

Notas explicativas

Los servicios u organismos hidrológicos de los Miembros de la OMM se enumeran en seis cuadros (3.1 a 3.6), uno por cada una de las seis Regiones de la OMM. A continuación se proporciona la explicación de los símbolos utilizados en estos cuadros, siguiendo el orden de los títulos de las columnas:

Columna (1) - Estado o Territorio:

- Tipo de coordinación entre organismos
- Nombre y dirección del organismo
- Autoridad responsable (Ministerio)

En esta columna se enumeran, bajo el nombre de cada Miembro de la OMM, los organismos nacionales que se ocupan de hidrología operativa y recursos hídricos, además de su dirección y las autoridades o ministerio de los cuales depende cada organismo. También se proporciona información sobre la coordinación entre organismos, que puede corresponder a alguno de los siguientes tipos:

- todos los servicios están combinados (un solo organismo);
- la coordinación es realizada por uno de los organismos enumerados (se indica el número del organismo);
- la coordinación es realizada por un organismo nacional diferente;
- la coordinación es ad hoc, según las necesidades;
- otros.

Columna (2) - Principales actividades del organismo: Las letras usadas en el cuadro indican las actividades según el siguiente detalle:

- G - Hidrología general
H - Producción de energía hidroeléctrica
A - Agricultura (irrigación)
W - Abastecimiento de agua
F - Control de las inundaciones
P - Control de la contaminación
N - Navegación
T - Otros

Columna (3) - Nivel (de actividad):

- N - Nacional
R - Regional (subnacional)

Columna (4) - Estaciones hidrológicas: Los encabezados A a K de las subcolumnas indican los tipos de redes que explota cada organismo, según el siguiente detalle:

- A - Observaciones hidrométricas
- B - Observaciones del agua subterránea
- C - Observaciones climatológicas con fines hidrológicos
- D - Nieve
- E - Lagos (altura)
- F - Glaciares (avance y retroceso)
- G - Estuarios
- H - Espesor del hielo en los cuerpos de agua dulce
- I - Humedad del suelo
- J - Transporte de sedimentos
- K - Calidad del agua (física y química)

La participación del organismo en la explotación de estas redes en el país se indica con los números 1, 2 y 3, según el siguiente detalle:

- 1 - el principal organismo responsable de estas redes en el país;
- 2 - un organismo con participación secundaria;
- 3 - otro(s) organismo(s) que explotan estas redes.

Columna (5) - Anuarios o resúmenes, y Columna (6) - Catálogos de datos: Ambas columnas están codificadas como la Columna 4) (Estaciones hidrológicas), pero sólo para las categorías A - Observaciones hidrométricas, B - Observaciones del agua subterránea y C - Observaciones climatológicas con fines hidrológicos.

Los Cuadros 3.7 a 3.9 ofrecen resúmenes por Región de la OMM de los organismos hidrológicos nacionales, la explotación de las redes hidrológicas y las actividades de los organismos nacionales respectivamente.

IV - HYDROLOGICAL OBSERVING STATIONS

TABLES 4.1.01 to 4.7

Explanatory Notes

The tables in this chapter show the number of hydrological observing stations operating in each country by WMO Region as follows:

Table(s) No(s)	Type of station
4.r.01 to .07	Precipitation
4.r.08	Evaporation
4.r.09	Discharge
4.r.10	Stage (water level)
4.r.11	Sediment and water quality
4.r.12	Groundwater (wells)

The letter "r" above denotes the WMO Region (I to VI as 1 to 6) in the table numbers.

Where possible, the observing stations have been classified by length of record:

- Less than five years;
- Five to 10 years;
- 10 to 30 years;
- Over 30 years.

The total number of observing stations is also shown. This total may exceed the sum of the previous four columns when some stations have not been classified by length of record. It should be noted that data prior to 1980 have been taken from **Operational Hydrology Report No. 10** (WMO-No. 464) and in that publication all record lengths over 10 years are included in a single category, with no division at 30 years. These data have been arbitrarily included under 10 to 30 years in these tables, with the over-30 years column left blank.

In all tables the first three columns are the same:

Column (1) - Country name

Column (2) - Total area of the country

Column (3) - Year in which the data were collected.

Details of the individual tables are as follows:

Tables 4.r.01 to 4.r.06 - Precipitation stations for different elevation bands

The elevation bands used are:

4.r.01	0 to 500 m above sea-level
4.r.02	501 to 1 000 m

4.r.03	1 001 to 1 500 m
4.r.04	1 501 to 2 000 m
4.r.05	2 001 to 2 500 m
4.r.06	over 2 500 m.

The columns are:

Column (4): % area - the percentage of the area of the country which lies in this elevation band

Column (5): Number of non-recording precipitation gauges in the country in this elevation band, classified by length of record as described above

Column (6): Number of recording precipitation gauges [as for Column (5)]

Column (7): The number of telemetering gauges

Column (8): The number of radars used for rainfall measurement.

Only countries reporting gauges in the relevant elevation range are included in each table. This can result in a blank table which has not been printed.

The "Totals" row shows totals of the figures in each column. Note in particular that the total in **Column (2)** is the sum of the areas of the countries listed, and not the area of the region in the elevation band.

Tables 4.r.07: Precipitation observing stations - Totals

This table gives all precipitation gauges, irrespective of elevation. It is set out as **Tables 4.r.01 to 4.r.06**, except that the "% area" column has been omitted. The numbers in this table may exceed the sums of the previous six tables. This arises when not all gauges have been classified by elevation.

For each of the six WMO Regions, a map of the non-recording precipitation gauges density (number of gauge per 1000 km²) is included.

Tables 4.r.08: Evaporation stations

Column (4) shows numbers of evaporation pans, of all types: US Class A, GCI-3000 (USSR), etc. The number of pans of various types is available but not published here.

Column (5) - Indirect methods - includes energy budget, aerodynamic, combined and other methods of measuring evaporation.

Tables 4.r.09: Hydrological observing stations - Discharge

These are, generally, water level stations with a rating enabling the calculation of discharge. They are grouped under "recording", **Column (4)**, and "non-recording", **Column (5)**, **stations**. **Column (6)** gives the total of these two groups and **Column (7)** the number of telemetering stations.

For each of the six WMO Regions, a map of the discharge measuring station density (number of stations per 1000 km²) is included.

Tables 4.r.10: Hydrological observing stations - Stage (water level)

This table, which is presented as in **Table 4.r.09**, shows the numbers of water level stations which are not used for discharge computation.

Tables 4.r.11: Hydrological observing stations - Sediment and water quality

The sediment stations are grouped into *suspended sediment (Column (4)), and bed-load (Column (5))*, *measuring stations*. Column (6) shows *water quality stations of all types*. No breakdown by parameter measured is available.

Tables 4.r.12: Groundwater stations (wells)

The columns show:

- Column (4):** *Level measurements*, either at special observation wells or at production wells (Prod). The observation wells are either recording (Rec) or non-recording (N-rec).
- Column (5):** *Temperature measurement stations*. Grouped under observation wells (Obsn) or production wells (Prod)
- Column (6):** *Water quality measurements (Obsn or Prod)*
- Column (7):** *Other groundwater measurements (Obsn or Prod)*.

Table 4.7 summarizes the total numbers of observing stations in each WMO Region.

IV - STATIONS D'OBSERVATION HYDROLOGIQUE

TABLEAUX 4.1.01 à 4.7

Notes explicatives

Les tableaux de cette section indiquent le nombre de stations d'observation hydrologique exploitées dans chaque pays, par Région de l'OMM comme suit :

Tableau(x) N°(s)	Type de station
4.r.01 à .07	Précipitations
4.r.08	Evaporation
4.r.09	Débit
4.r.10	Hauteur d'eau (niveau de l'eau)
4.r.11	Charge solide et qualité de l'eau
4.r.12	Eau souterraine (puits)

Dans les numéros de tableaux ci-dessus, la lettre "r" indique la Région de l'OMM (les chiffres 1 à 6 correspondent aux Régions I à VI).

Dans la mesure du possible, les stations d'observation sont classées en fonction de la durée de la période de relevé :

- Moins de cinq ans;
- Cinq à 10 ans;
- 10 à 30 ans;
- Plus de 30 ans.

Le nombre total de stations d'observation est également indiqué. Il peut être supérieur à la somme des quatre colonnes précédentes, lorsque certaines stations ne figurent pas dans la classification en fonction de la durée de la période de relevé. On notera que les données antérieures à 1980 sont tirées du **Operational Hydrology Report N° 10 (WMO-N° 464)** et que dans ce rapport toutes les périodes de relevé supérieures à dix ans sont regroupées en une seule catégorie, non limitée à trente ans. Dans les tableaux dont il est question ici, les données correspondantes figurent arbitrairement dans la colonne "10 à 30 ans", la colonne "plus de 30 ans" restant alors vide.

Dans tous les tableaux, les trois premières colonnes sont réservées aux indications suivantes :

- Colonne (1) - Nom du pays
Colonne (2) - Superficie totale du pays
Colonne (3) - Année où les données ont été recueillies*

Pour les autres colonnes, les détails concernant les divers tableaux sont indiqués ci-après :

Tableaux 4.r.01 à 4.r.06 : Stations pluviométriques pour différentes zones altitudinales

Les zones altitudinales sont les suivantes :

4.r.01	0 à 500 m au-dessus du niveau de la mer
4.r.02	501 à 1000 m
4.r.03	1001 à 1500 m
4.r.04	1501 à 2000 m
4.r.05	2001 à 2500 m
4.r.06	plus de 2500 m

Les indications fournies dans les colonnes (4) à (8) sont les suivantes :

Colonne (4) : % de la superficie - Pourcentage de la superficie du pays qui se situe dans la zone altitudinale visée

Colonne (5) : Nombre de pluviomètres non enregistreurs du pays situés dans la zone altitudinale concernée, classés en fonction de la durée de la période de relevé comme indiqué ci-dessus

Colonne (6) : Nombre de pluviomètres enregistreurs [comme pour la Colonne (5)]

Colonne (7) : Nombre de pluviomètres de télémesure

Colonne (8) : Nombre de radars utilisés pour la mesure des précipitations.

Ne sont inclus dans chaque tableau que les pays communiquant des indications pour des pluviomètres situés dans la zone altitudinale visée. D'où la possibilité d'un tableau vide, ne fournissant aucune indication et qui, dans ce cas, n'a pas été imprimé.

Sur la rangée "Totaux" sont indiqués les totaux pour chaque colonne. On notera en particulier que le total dans la **Colonne 2** représente la somme des superficies des pays énumérés, et non pas la superficie correspondante à la zone altitudinale visée.

Tableau 4.r.07 : Stations d'observation des précipitations - Totaux

Les indications données dans ce tableau concernent l'ensemble des pluviomètres quelle que soit l'altitude. La forme de présentation est ici la même que pour les **tableaux 4.r.01 à 4.r.06**, sauf que la colonne "% de la superficie" est absente. Les chiffres indiqués dans ces tableaux peuvent être supérieurs à la somme des chiffres des six tableaux précédents. Tel est le cas lorsque tous les pluviomètres n'ont pas été classés dans les zones altitudinales.

Une carte de la densité des pluviomètres non enregistreurs (nombre de pluviomètres par 1000 km²) a été incluse pour chacune des six Régions de l'OMM.

Tableau 4.r.08 : Stations évaporométriques

La Colonne (4) indique le nombre de bacs d'évaporation, de tous types : US Class A, GGI-3000 (ancienne URSS), etc. Le nombre de bacs de divers types est connu, mais il n'est pas indiqué ici.

La Colonne (5) - Méthodes indirectes - correspond à des méthodes de bilan énergétique, des méthodes basées sur la dynamique de l'atmosphère, des méthodes combinées et d'autres méthodes de mesure de l'évaporation.

Tableau 4.r.09 : Stations d'observation hydrologique - Débit

Il s'agit, d'une manière générale, de stations limnimétriques pour lesquelles il existe une courbe d'étalonnage permettant le calcul du débit. On distingue ici deux groupes de stations, selon qu'il s'agit de *stations "avec enregistrement" (limnigraphique) (Colonne (4))* ou de *stations "sans enregistrement" (limnimétrique) (Colonne (5))*. La Colonne (6) indique le total de ces deux groupes de stations, et la Colonne (7) le nombre de stations de télémesure.

Une carte de la densité des stations de mesure du débit (nombre de stations pour 1000 km²) a été incluse pour chaque Région de l'OMM.

Tableau 4.r.10 : Stations d'observation hydrologique - Hauteur d'eau (niveau de l'eau)

Ce tableau, dont la forme de présentation est la même que celle du tableau 4.r.09, indique le nombre de stations limnimétriques qui ne sont pas utilisées pour le calcul du débit.

Tableau 4.r.11 : Stations d'observation hydrologique - Charge solide et qualité de l'eau

Les stations de mesure de la charge solide sont réparties en deux groupes : *stations de mesure de la charge solide en suspension (Colonne (4))*, et *stations de mesure du transport de fond (Colonne (5))*. La Colonne (6) indique tous les types de stations de mesure de la qualité de l'eau. L'on ne dispose pas d'une répartition en fonction du paramètre mesuré.

Tableau 4.r.12 : Stations de mesure des eaux souterraines (puits)

Les indications présentées par les Colonnes (4) à (7) sont les suivantes :

Colonne (4) : Mesures du niveau effectuées dans des puits d'observation spéciaux ou des puits de production (Prod). Les puits d'observation peuvent être munis d'enregistreurs (Rec) ou non (N-rec).

Colonne (5) : Stations de mesure de la température. Elles se répartissent en puits d'observation (Obsn) et en puits de production (Prod).

Colonne (6) : Mesures de la qualité de l'eau (Obsn ou Prod).

Colonne (7) : Autres mesures des eaux souterraines (Obsn ou Prod).

Le Tableau 4.7 est un tableau récapitulatif indiquant le nombre total d'observations dans chaque Région de l'OMM

IV - ГИДРОЛОГИЧЕСКИЕ НАБЛЮДАТЕЛЬНЫЕ СТАНЦИИ

ТАБЛИЦЫ 4.1.01-4.7

Пояснительные записки

В таблицах данной главы указывается количество гидрологических наблюдательных станций, функционирующих в каждой стране в соответствии с разделением по Регионам ВМО.

Таблица(ы) №(№)	Тип станции
4.r.01-07	Осадки
4.r.08	Истарение
4.r.09	Расход воды
4.r.10	Уровень (воды)
4.r.11	Паносы и качество воды
4.r.12	Подземные воды (скважины)

Буква "r", используемая выше, обозначает Регион ВМО (I-VI как 1-б).

Везде, где возможно, наблюдательные станции классифицированы по длине ряда наблюдений:

- мене 5 лет;
- 5-10 лет;
- 10-30 лет;
- более 30 лет.

Указывается также общее число наблюдательных станций. Это число может превышать сумму предыдущих четырех колонок в том случае, если некоторые станции не были классифицированы по длине ряда наблюдений. Следует отметить, что данные, относящиеся к периоду до 1980 г., были взяты из отчета по оперативной гидрологии № 10 (Публикация ВМО № 464), в котором все ряды наблюдений, длинее 10 лет, включены в единую категорию. Эти данные были произвольно включены в градацию "10-30 лет" в описываемых таблицах, причем колонка "более 30 лет" оставлена незаполненной.

Во всех таблицах первые три колонки являются одинаковыми:

- Колонка (1) - Название страны
Колонка (2) - Общая площадь страны
Колонка (3) - Год, по которому собраны данные.*

Подробности, касающиеся отдельных таблиц, приводятся ниже:

Таблицы 4.r.01 - 4.r.06 - Осадкомерные станции для различных интервалов высот

Использованы следующие интервалы высот:

4.r.01	0-500 м над уровнем моря
4.r.02	501-1000 м
4.r.03	1001-1500 м
4.r.04	1501-2000 м
4.r.05	2001-2500 м
4.r.06	более 2500 м

Содержание колонок:

- Колонка (4):** % площади - процентная доля площади страны, которая располагается в данном интервале высот
- Колонка (5):** количество необорудованных самописцами осадкомеров в стране в данном интервале высот, классифицированное по длине ряда наблюдений в соответствии с вышеупомянутым описанием
- Колонка (6):** количество оборудованных самописцами осадкомеров [как для колонки (5)]
- Колонка (7):** количество дистанционных осадкомеров
- Колонка (8):** количество радиолокаторов, используемых для измерения жидких осадков.

В каждую таблицу включены осадкомеры только тех стран, которые сообщили о расположении осадкомеров в соответствующем интервале высот. В результате получились незаполненные таблицы, которые не напечатаны.

В ряде граф "Totals" указываются общие суммы по каждой колонке. В частности, примите во внимание, что сумма в **колонке (2)** является суммой площадей перечисленных стран, а не площадью, охватываемой данным интервалом высот.

Таблица 4.г.07: Осадкомерные станции - Итоги

В этой таблице сведены все осадкомерные посты без учета высоты их расположения. Эта таблица построена так же, как и таблицы 4.г.01-4.г.06, за исключением того, что колонка "% площади" опущена. Количество, указанные в данной таблице, могут превышать суммы предыдущих шести таблиц. Это происходит тогда, когда не все осадкомеры классифицированы по высоте их расположения.

Для каждого из шести Регионов ВМО прилагается карта плотности расположения необорудованных самописцами осадкомеров (количество осадкомеров на 1000 км²).

Таблица 4.г.08: Станции наблюдений за испарением

В **колонке (4)** указывается количество испарителей всех типов: класс А США, ГГИ-3000 (СССР) и т.д. Данные по количеству испарителей различных типов имеются, но здесь не публикуются.

Колонка (5) - Непрямые методы - в них входит метод энергетического бюджета, аэродинамический, комплексный и другие методы измерения испарения.

Таблица 4.г.09: Гидрологические наблюдательные станции - Расход воды

Сюда, как правило, относятся водомерные станции, для которых имеется зависимость расхода от уровня, что дает возможность вычисления расхода воды. Они сгруппированы по двум типам станций: "оборудованные самописцами", **колонка (4)**, и "необорудованные самописцами", **колонка (5)**. В **колонке (6)** приводится сумма этих двух групп, а в **колонке (7)** - количество дистанционных станций.

Для каждого из шести Регионов ВМО прилагается карта плотности расположения станций по измерению расхода воды (количество станций на 1000 км²).

Таблицы 4.r.10: Гидрологические наблюдательные станции - Уровень (воды)

В этой таблице, которая имеет ту же самую форму, что и таблица 4.r.09, показаны количества водомерных станций, которые не используются для вычисления расхода.

Таблицы 4.r.11: Гидрологические наблюдательные станции - Наносы и качество воды

Станции для измерения наносов группируются следующим образом: взвешенные наносы (*колонка (4)*) и влекомые наносы (*колонка (5)*). В *колонке (6)* указываются все типы станций, измеряющих качество воды. Разбивки по измеряемым параметрам не имеется.

Таблицы 4.r.12: Станции для наблюдений за подземными водами (скважины)

В колонках указываются:

- Колонка (4):* Измерение уровня либо в специальных наблюдательных скважинах, либо в эксплуатационных скважинах (Prod). Наблюдательные скважины либо оборудованы самописцами (Rec), либо необорудованы (N-rec).
- Колонка (5):* Станции для измерения температуры. Сгруппированы по наблюдательным (Obsn) или эксплуатационным (Prod) скважинам.
- Колонка (6):* Измерение качества воды (Obsn или Prod).
- Колонка (7):* Измерение других параметров подземных вод (см. выше).

В таблице 4.7 резюмируется общее количество наблюдательных станций по каждому Региону ВМО.

IV - ESTACIONES DE OBSERVACIÓN HIDROLÓGICA

CUADROS 4.1.01 a 4.7

Notas explicativas

Los cuadros de este capítulo muestran el número de estaciones de observación hidrológica en explotación en cada país, por Región de la OMM, según el siguiente detalle:

Cuadro(s) N°(s)	Tipo de estación
4.r.01 a 07	Precipitación
4.r.08	Evaporación
4.r.09	Caudal
4.r.10	Altura (nivel del agua)
4.r.11	Sedimentos y calidad del agua
4.r.12	Agua subterránea (pozos)

La letra "r" de la primera columna indica la Región de la OMM (I a VI como 1 a 6) en los números del cuadro.

En la medida de las posibilidades las estaciones de observación han sido clasificadas por tiempo de duración del registro:

- Menos de 5 años;
- cinco a 10 años;
- diez a 30 años;
- más de 30 años.

Se indica asimismo el número total de estaciones de observación. Este total puede superar la suma de las cuatro columnas anteriores en los casos en que algunas estaciones no se han clasificado por tiempo de duración del registro. Debería tenerse presente que los datos anteriores a 1980 se han tomado del **Informe de Hidrología Operativa N° 10 (OMM-N° 464)**, publicación en la que todos los períodos de registro de más de 10 años se incluyen en una categoría única, sin división alguna a los 30 años. Estos datos se han incluido arbitrariamente en la parte "10 a 30" años de estos cuadros, dejando en blanco la columna correspondiente a más de 30 años.

En todos los cuadros las tres primeras columnas son las mismas:

Columna (1): Nombre del país

Columna (2): Superficie total del país

Columna (3): Año en que se recopilaron los datos.

Los detalles de los cuadros son los siguientes:

Cuadros 4.r.01 a 4.r.06 - Estaciones de medición de la precipitación para diferentes niveles de altura

Los niveles de altura considerados son los siguientes:

4.r.01	O a 500 m sobre el nivel del mar
4.r.02	501 a 1000 m

4.r.03	1 001 a 1 500 m
4.r.04	1 501 a 2 000 m
4.r.05	2 001 a 2 500 m
4.r.06	más de 2 500 m.

Las columnas son las siguientes:

Columna (4): % superficie - porcentaje de la superficie del país que se halla a este nivel de altura

Columna (5): Número de pluviómetros en el país en este nivel de altura, clasificados por tiempo de duración del registro según se describe anteriormente

Columna (6): Número de pluviógrafos [como en la Columna (5)]

Columna (7): Número de pluviómetros telemétricos

Columna (8): Número de radares utilizados para la medición de la precipitación.

Sólo se incluyen en cada cuadro los países que dan cuenta de pluviómetros en el pertinente nivel de altura. Esto puede traducirse en un cuadro en blanco que no ha sido impreso.

La columna "Total" indica los totales de las cifras de cada columna. Nótese en particular que el total de la **Columna (2)** es la suma de las superficies de los países enumerados y **no** la superficie de la región que se halla en ese nivel de altura.

Cuadros 4.r.07: Estaciones de observación de la precipitación - Totales

Este cuadro presenta todos los pluviómetros, sin tener en cuenta la altura. Está organizado como los **Cuadros 4.r.01 a 4.r.06**, con la diferencia de que se ha omitido la columna "% superficie". Los números de este cuadro pueden superar las sumas de los seis cuadros anteriores. Esto ocurre cuando no todos los pluviómetros se han clasificado por nivel de altura.

Se incluye para cada una de las seis Regiones de la OMM un mapa de la densidad de los pluviómetros (número de pluviómetros por 1000 km²).

Cuadro 4.r.08: Estaciones de evaporación

La Columna (4) presenta el número de tanques de evaporación de todo tipo: Clase A de EE.UU., GGI-300 (antigua URSS), etc. Aunque se conoce el número de tanques de diversos tipos, no se ha incluido en esta publicación.

La Columna (5) - Métodos indirectos - incluye métodos de balance de energía, de dinámica de la atmósfera, combinados, y otros métodos de medición de la evaporación.

Cuadros 4.r.09: Estaciones de observación hidrológica - Descarga

Generalmente se trata de estaciones de medición del nivel de agua con una curva de aforo que les permite calcular el caudal. Se encuentran agrupadas como **estaciones registradoras** [**Columna (4)**] y **no registradoras** [**Columna (5)**]. **La Columna (6) presenta el total de estos dos grupos y la Columna (7) el número de estaciones de telemetría.**

Se incluye para cada una de las seis Regiones de la OMM, un mapa de la densidad de estaciones de medición de caudal (número de estaciones por 1000 km²).

Cuadros 4.r.10: Estaciones de observación hidrológica - Altura (nivel del agua)

Este cuadro, que se presenta como el Cuadro 4.r.09, indica el número de estaciones de medición del nivel de agua que no se usan para el cálculo del caudal.

Cuadros 4.r.11: Estaciones de observación hidrológica - Sedimentos y calidad del agua

Las estaciones de medición de los sedimentos se agrupan en *estaciones de medición de los sedimentos suspendidos (Columna (4)) y del arrastre de fondo (Columna (5))*. La Columna (6) indica todo tipo de estaciones de medición de la calidad del agua. No se dispone de ningún análisis por parámetro medido.

Cuadros 4.r.12: Estaciones de medición del agua subterránea (pozos)

Las columnas indican los siguientes elementos:

Columna (4): *Mediciones de nivel*, ya sea en pozos especiales de observación o en pozos de producción (Prod). Los pozos de observación pueden ser registradores (Rec) o no registradores (N-rec)

Columna (5): *Estaciones de medición de la temperatura*. Agrupadas en la parte correspondiente a los pozos de observación (Obsn) o los pozos de producción (Prod)

Columna (6): *Mediciones de la calidad del agua (Obsn o Prod)*

Columna (7): *Otras mediciones del agua subterránea (Obsn o Prod)*

El Cuadro 4.7 resume el número total de estaciones de observación de cada Región de la OMM.

Notes: Data are shown only for countries which have reported stations in this elevation range.

The values in the Total columns may exceed the sum of the values in previous columns when not all gauges have been classified by length of record.

V - NATIONAL HYDROLOGICAL DATA BANKS

TABLES 5.1.1 to 5.8

Explanatory notes

A "data bank" here implies a **computerized** data bank only. A complete national hydrological data bank would contain data and statistics covering all hydrological variables for all parts of a country and would permit any user to easily extract and use these data without extensive manipulation. It is not necessarily a single physical data bank controlled by one agency at one site. If hydrological data in different banks can easily be accessed, transferred, and used by standard computer programs and formats, it is considered that a national bank exists at a certain level of development.

Tables 5.r.1: Hydrological data banks and archiving (by Region)

This table presents, for each country, the status of data-processing facilities, the data banks and the archives. The letter "r" above denotes the WMO Region (I to VI as 1 to 6) in the table numbers. The column headings are:

Column (3) - Method: indicates computer or manual method of data processing and archiving.

Column (4) - No. of agencies: number of Agencies for which information is given in Tables 5.r.1 and 5.r.2.

Column (5) - Type of data bank: the data banks are classified as:

- (a) **Centralized:** one national data bank covering all hydrological parameters for all parts of the country, permitting any user to easily obtain and transfer these data using standardized computer programs and formats, etc.;
- (b) **Co-ordinated:** several data banks covering all hydrological parameters with some type of co-ordinating arrangement between banks or agencies so that data in different banks can easily be obtained and transferred without extensive manipulation aimed at making different formats compatible for computer treatment;
- (c) **Limited:** a centralized data bank but covering only one or a few of the many hydrological parameters.

Column (6) - Percentage (%) total data in archives: this column consists of seven sub-columns representing archived data on:

Lvl	-	Water levels (stages)
Dis	-	Discharges (streamflow)
GW	-	Groundwater
WQ	-	Water quality
Sed	-	Sediment
Ppt	-	Precipitation
Evp	-	Evaporation

V - BANQUES DE DONNÉES HYDROLOGIQUES NATIONALES

TABLEAUX 5.1.1 à 5.8

Notes explicatives

Le terme "banques de données" désigne ici uniquement des banques de données **informatisées**. Une banque nationale de données hydrologiques complète devrait contenir des données et des statistiques concernant l'ensemble des variables hydrologiques pour toutes les parties d'un pays et permettre à tout utilisateur d'extraire et d'utiliser facilement ces données sans trop de manipulations. Il ne s'agit pas nécessairement d'une banque de données unique gérée par un seul organisme en un seul endroit. Si l'on peut facilement avoir accès à des données hydrologiques dans différentes banques, les transférer et les utiliser à l'aide de programmes et de formats informatiques standard, on considère alors qu'il existe une banque de données nationale, avec un certain niveau de développement.

Tableau 5.r.1 : Banques de données hydrologiques et archivage (par Région)

Ce tableau présente, pour chaque pays, la situation concernant les moyens et installations de traitement de données, les banques et les archives. La lettre "r" correspond au chiffre (de 1 à 6) qui, dans l'en-tête des tableaux, désigne la Région de l'OMM (de I à VI). Les en-têtes des colonnes sont les suivants :

Colonne (3) - Méthode : méthode, informatique ou manuelle, de traitement et d'archivage.

Colonne (4) - Nombre d'organismes : nombre des organismes auxquels correspondent les informations figurant dans les tableaux 5.r.1 et 5.r.2.

Colonne (5) - Type de banque : on distingue trois catégories de banques de données, classées selon le type d'organisation :

- a) **banques centralisées** : banques nationales contenant des données pour tous les paramètres hydrologiques et toutes les régions du pays, ce qui permet à n'importe quel usager d'obtenir et de transférer aisément les données en utilisant des programmes informatiques et des modes de présentation normalisés, etc.;
- b) **banques régie par un accord de coordination**, conclu entre banques ou organismes, qui, à eux tous, couvrent l'ensemble des paramètres hydrologiques pour tout le pays et aux termes duquel il est possible d'obtenir et de transférer des données de ces banques, sans manipulations complexes visant à rendre compatibles leurs modes de présentation pour leur traitement informatique;
- c) **banques de données partielles** : banques centralisées, mais ne contenant de données que pour quelques paramètres hydrologiques, voire un seul.

La mention "YES" (OUI) à la place d'un chiffre indique que les données sont reçues sous forme numérique ou traitées par ordinateur, mais que le pourcentage n'est pas connu.

Les tableaux 5.7 et 5.8 présentent un état récapitulatif, par Région de l'OMM, respectivement pour les banques de données hydrologiques et les activités d'archivage, et pour la collecte et les activités de traitement des données hydrologiques.

V - НАЦИОНАЛЬНЫЕ БАНКИ ГИДРОЛОГИЧЕСКИХ ДАННЫХ

ТАБЛИЦЫ 5.1.1-5.8

Пояснительные записки

В настоящем Наставлении "банк данных" понимается только как компьютеризированный банк данных. Полный национальный банк гидрологических данных мог бы содержать данные и статистические параметры, охватывающие все гидрологические переменные по всем частям страны, и мог бы дать возможность любому пользователю легко извлекать и использовать эти данные без больших манипуляций. Необязательно, чтобы физически единый банк данных управлялся одним агентством в одном месте. Если к гидрологическим данным, находящимся в различных банках, можно легко осуществлять доступ, осуществить их передачу и использовать с помощью стандартных компьютерных программ и форматов, то можно считать, что существует национальный банк на определенном уровне развития.

Таблица 5.г.1: Банки и архивация гидрологических данных (по Региону)

В данной таблице по каждой стране представляются сведения о состоянии технических средств обработки данных, банков данных и архивов. В номерах таблиц вышеуказанный буква "г" определяет Регион ВМО (I-VI как 1-6). Заголовки колонок следующие:

Колонка (3) - Метод: указывает компьютерный или ручной метод обработки и архивации данных.

Колонка (4) - Количество агентств: количество агентств, по которым приводится информация в таблицах 5.г.1 и 5.г.2.

Колонка (5) - Тип банка данных: банки данных классифицированы следующим образом:

- a) **централизованный:** один национальный банк данных, охватывающий все гидрологические параметры для всех частей страны, позволяющий любому пользователю легко получить и передать эти данные с использованием стандартизованных компьютерных программ и форматов и т.д.; или
- b) **координированный:** несколько банков данных, охватывающих все гидрологические параметры при наличии некоторых координационных соглашений между банками или агентствами, с тем чтобы данные, содержащиеся в различных банках, могли быть легко получены и переданы без больших манипуляций, предназначенных для того, чтобы сделать различные форматы совместимыми для компьютерной обработки; или
- c) **ограниченный:** централизованный банк данных, но охватывающий только один или небольшое количество из многих гидрологических параметров.

Колонка (6) - Процентная доля (%) от общего количества данных, которая находится в архивах: данная колонка состоит из семи подколонок, представляющих помещенные в архив данные по следующим параметрам:

- | | | |
|-----|---|----------------------|
| Lvl | - | уровни воды (уровни) |
| Dis | - | расходы (сток) |
| GW | - | подземные воды |
| WQ | - | качество воды |

V - BANCOS DE DATOS HIDROLÓGICOS NACIONALES

CUADROS 5.1.1 a 5.8

Notas explicativas

En este caso "banco de datos" sólo significa banco de datos en ordenador. Un banco nacional de datos hidrológicos completo contendría datos y estadísticas que abarcarían todas las variables hidrológicas para todas las regiones de un país y permitiría a cualquier usuario extraer y utilizar fácilmente esos datos sin un tratamiento extenso. No se trata necesariamente de un banco de datos físico único controlado por un organismo dado en un sitio dado. Si los datos hidrológicos de bancos diferentes pueden obtenerse, transferirse y utilizarse fácilmente mediante programas y formatos de ordenador normalizados, se puede considerar que un banco nacional existe a determinado nivel de desarrollo.

Cuadros 5.r.1: Bancos y archivo de datos hidrológicos (por Región)

Este cuadro presenta para cada país el estado de los medios e instalaciones de proceso de datos, los bancos de datos y los archivos. La letra "r" de los números del cuadro indica la Región de la OMM (I a VI como 1 a 6). Los encabezamientos de las columnas son los siguientes:

Columna (3) - Método: Indica el método computarizado o manual de proceso y archivo de datos.

Columna (4) - Número de organismos: Número de organismos para los cuales se brinda información en los Cuadros 5.r.1 y 5.r.2.

Columna (5) - Tipos de bancos de datos: Los bancos de datos se clasifican de la siguiente manera:

- a) **centralizados:** bancos de datos nacionales que abarcan todos los parámetros hidrológicos para todas las zonas del país, permitiendo a cualquier usuario obtener y transferir fácilmente dichos datos mediante la utilización de programas y formatos de ordenador normalizados, etc.;
- b) **coordinados:** varios bancos de datos que abarcan todos los parámetros hidrológicos con cierto tipo de arreglo para la coordinación entre los bancos o los organismos, de modo tal que los datos de los diferentes bancos puedan conseguirse y transferirse con facilidad sin un tratamiento extenso tendiente a lograr que los diferentes formatos sean compatibles para el tratamiento por ordenador;
- c) **limitados:** bancos de datos centralizados pero que abarcan sólo uno o unos pocos de los muchos parámetros hidrológicos.

Columna (6) - Porcentaje (%) del total de datos de los archivos: esta columna consta de siete subcolumnas que representan los datos archivados relativos a los siguientes elementos:

Lvl	-	Niveles de agua (altura)
Dis	-	Caudal (flujo de corriente)
GW	-	Agua subterránea
WQ	-	Calidad del agua
Sed	-	Sedimentos
Ppt	-	Precipitación
Evp	-	Evaporación

VI - INTERNATIONAL DATA BANKS RELATED WITH HYDROLOGY AND WATER RESOURCES

Explanatory Notes

The purpose and scope of Section VI of the Manual is to provide information on international data banks, which can be useful for hydrology and water resources related activities, by means of a brief presentation of each of them.

For each of the international data banks included in this section information is given on:

- the type of data stored (actual data, metadata),
- the status of collection (dates, record lengths),
- how the data are stored, handled and updated,
- how to request data.

Generally, extracts from data bank outputs are shown as examples.

Additional selected international data banks in the field of hydrology and water resources are listed in **Table VI.1**

VI - BANQUE DE DONNÉES INTERNATIONALES CONCERNANT L'HYDROLOGIE ET LES RESSOURCES EN EAU

(Notes explicatives)

La Section VI du Manuel a pour objectif de fournir des renseignements sur les banques de données internationales, qui peuvent être utiles aux activités se rapportant à l'hydrologie et aux ressources en eau, chacune de ces banques de données faisant l'objet d'une brève présentation.

Pour chaque banque de données internationale comprise dans cette Section, des renseignements seront fournis sur :

- le type de données enregistrées (données réelles, données globales),
- la collecte des données (dates, longueur des relevés),
- la façon dont les données sont enregistrées, gérées et mises à jour,
- la façon de procéder pour demander des données.

En général des extraits de documents élaborés à partir de ces banques de données sont fournis à titre d'exemple.

Une sélection d'autres banques de données internationales dans le domaine de l'hydrologie et des ressources en eau figure au Tableau VI.1.

VI - МЕЖДУНАРОДНЫЕ БАНКИ ДАННЫХ, ОТНОСЯЩИХСЯ К ГИДРОЛОГИИ И ВОДНЫМ РЕСУРСАМ

Пояснительные записки

Цель и сфера применения, описанные в разделе VI Настоящего, состоят в обеспечении информацией по международным банкам данных, которые могут быть использованы в деятельности, связанной с гидрологией и водными ресурсами, посредством краткого описания каждого из них.

По каждому из международных банков данных, включенных в этот раздел, приводится следующая информация:

- тип хранящихся данных (текущие данные, метаданные);
- состояние сбора данных (даты, длина записей);
- способ хранения, обработки и обновления;
- способ запроса данных.

Как правило, в качестве примеров приводятся образцы выходных данных.

Избранные международные банки данных в области гидрологии и водных ресурсов составлены в таблице VI. 1.

VI - Bancos de datos internacionales relacionados con la hidrología y los recursos hídricos

Notas explicativas

La finalidad y el alcance de la Sección VI del Manual es proporcionar información sobre bancos de datos internacionales, que pueden ser útiles para las actividades relacionadas con la hidrología y los recursos hídricos, mediante una breve presentación de cada uno de ellos.

Con respecto a cada uno de los bancos de datos internacionales incluidos en esta sección se facilita información sobre:

- el tipo de datos almacenados (datos reales, metadatos);
- el estado de recopilación (fechas, duraciones de los registros);
- manera de almacenar, tratar y actualizar los datos;
- manera de solicitar datos.

En general, se muestran extractos de salidas de bancos de datos, a título de ejemplo.

Una selección de otros bancos de datos internacionales en el campo de la hidrología y recursos hídricos figura en la Tabla VI.1.

INTERNATIONAL DATA BANKS

VI.1 GLOBAL RUNOFF DATA CENTRE

VI.1.1 Introduction

On 1 May 1987, a permanent Global Runoff Data Centre (GRDC) was established at the Federal Institute of Hydrology in Koblenz, Federal Republic of Germany, under the auspices of the World Meteorological Organization (WMO).

The GRDC operates for the benefit of WMO Members and the international scientific community. It provides a mechanism for the international exchange of data pertaining to river flows and surface water runoff on a continuous long-term basis. The GRDC receives data from many sources, principally through WMO. While every attempt is made to assure reasonable standards for data quality and related documentation, the ultimate responsibility for data lies with the data contributors and not with the GRDC.

All data archived at the GRDC are available to users upon written request or personal visit.

VI.1.2 Data bank

The GRDC data bank, in March 1993, consisted of flows for 3070 stations from 140 countries. Complete daily flows are available for 1834 stations and monthly flows are available for 1509 stations.

The core of the data bank is the daily flows for 1,327 stations from 75 countries which were collected initially by the WMO Hydrology and Water Resources Department under the WMO/ICSU Global Atmosphere Research Programme (GARP), for use in validation of atmospheric general circulation models (GCMs), and later within the World Climate Programme (WCP).

The first available year for this set of data is 1978 and nearly all stations are complete up to 1980. Data from 40 countries are also available up to 1982-83 and from Australia up to 1984-85. The data base is being updated from time to time.

The stations have been selected according to the following criteria:

- Uniform national distribution (consistent with network conditions), with higher densities in areas of rapid variation of flow.
- Coverage, to the greatest extent possible, of each type of hydrological homogeneous region of each country.
- Relatively small river basins (up to about 5,000 km², and in exceptional cases, up to 10,000 km²).
- Flow data representing natural river flow, i. e. they should be corrected for diversions, abstractions and redistributions by storage.
- Good quality of records.

BANQUE DE DONNÉES INTERNATIONALES

VI.1 CENTRE MONDIAL DE DONNÉES SUR L'ÉCOULEMENT

VI.1.1 Introduction

Le 1er mai 1987, un Centre mondial de données sur l'écoulement (GRDC) permanent a été créé à l'Institut fédéral d'hydrologie de Coblenze (Allemagne) sous les auspices de l'Organisation météorologique mondiale (OMM).

Le GRDC, qui fonctionne au profit des Membres de l'OMM et de la communauté scientifique internationale assure un mécanisme d'échange international, permanent et de longue durée, de données sur le débit des fleuves et l'écoulement de surface. Il reçoit, principalement par l'intermédiaire de l'OMM, des données provenant de nombreuses sources. Même si le centre fait tout son possible pour garantir des normes de qualité correctes, en particulier dans les documents qu'il produit, il n'en reste pas moins que ce sont ceux qui fournissent les données et non le centre qui sont en fin de compte responsables de ces données.

Toutes les données archivées au GRDC sont disponibles et les usagers peuvent se les procurer sur demande écrite ou en se rendant personnellement au centre.

VI.1.2 Banque de données

En mars 1993, la banque de données du GRDC portait sur l'écoulement mesuré dans 3070 stations situées dans 140 pays différents. A cette date, étaient disponibles des séries complètes de données journalières pour 1834 stations et de données mensuelles pour 1509 stations.

La base autour de laquelle s'articule la banque de données est constituée par les données journalières sur l'écoulement fournies par 1327 stations situées dans 75 pays. Ces données, qui ont été rassemblées à l'origine par le Département d'hydrologie et de mise en valeur des ressources en eau de l'OMM, au titre du Programme de recherche sur l'atmosphère globale (GARP) OMM/CIUS, devaient tout d'abord servir à valider les modèles de la circulation générale (MCG) de l'atmosphère, avant d'être utilisées dans le cadre du Programme climatologique mondial (PCM).

La première année pour laquelle cet ensemble de données est disponible est 1978 et les données concernant presque toutes les stations sont complètes jusqu'en 1980. De plus, les données provenant de 40 pays différents sont disponibles jusqu'en 1982-1983 et celles fournies par l'Australie sont complètes jusqu'en 1984-1985. La base de données est mise à jour périodiquement.

La sélection des stations s'est effectuée selon les critères suivants :

- répartition nationale uniforme des stations (conforme aux caractéristiques du réseau), les densités étant supérieures dans les zones où le débit varie rapidement;
- à l'intérieur de chaque pays, représentation, dans toute la mesure du possible, de chaque type de région hydrologique homogène;
- bassins fluviaux relativement petits (jusqu'à environ 5000 km² et, dans certains cas exceptionnels, jusqu'à 10 000 km²);

МЕЖДУНАРОДНЫЕ БАНКИ ДАННЫХ

VI.1 ГЛОБАЛЬНЫЙ ЦЕНТР ДАННЫХ ПО СТОКУ

VI.1.1 Введение

Постоянный глобальный центр данных по стоку (ГЦДС) был основан 1 мая 1987 г. в Федеральном институте гидрологии в Кобленце, Федеративная Республика Германия, под эгидой Всемирной Метеорологической Организации (ВМО).

ГЦДС обеспечивает продукцией страны-члены ВМО и международное научное сообщество. Он представляет собой механизм для международного обмена данными, касающимися речного стока и стока поверхностных вод на постоянной долгосрочной основе. ГЦДС получает данные из различных источников, в основном через ВМО. Хотя прилагаются все усилия для обеспечения приемлемых стандартов качества данных и связанной с ними документации, основная ответственность за данные лежит не на ГЦДС, а на тех, кто их предоставляет.

Все данные, хранящиеся в ГЦДС, предоставляются пользователям по письменной заявке или в ходе персонального посещения.

VI.1.2 Банк данных

В марте 1993 г. в банке данных ГЦДС содержались данные о стоках, поступившие от 3070 станций из 140 стран. Данные о полном суточном стоке были представлены 1834 станциями, а данные о месячном стоке - 1509 станциями.

Основой банка данных являются данные о дневном стоке, представленные 1327 станциями из 75 стран, которые были собраны первоначально Департаментом гидрологии и водных ресурсов ВМО в рамках Программы исследований глобальных атмосферных процессов (ЛИГАП) под эгидой ВМО/МСНС для их использования в оценке атмосферных моделей общей циркуляции (МОЦ), а в дальнейшем в рамках Всемирной климатической программы (ВКП).

Этот набор данных впервые был подготовлен в 1978 г., и почти все станции были укомплектованы до 1980 г. Кроме того, были подготовлены данные из 40 стран до 1982-1983 гг. и данные из Австралии до 1984-1985 гг. База данных обновляется время от времени.

Станции были выбраны с учетом следующих критериев:

- равномерное распределение на национальном уровне (с учетом состояния сети) при обеспечении более высокой плотности в районах с быстрым изменением стока.
- как можно более широкий охват различных видов гидрологических однородных регионов каждой страны.
- относительно небольшие речные бассейны (приблизительно до 5 000 км², и, в исключительных случаях, до 10 000 км²).
- данные по стоку, представляющие естественный речной сток, то есть они должны быть скорректированы с учетом отвода, забора и перераспределения запаса воды.
- хорошее качество записей.

VI.1 CENTRO MUNDIAL DE DATOS DE ESCORRENTÍA

VI.1.1 Introducción

El 1 de mayo de 1987 se estableció en el Instituto Federal de Hidrología de Coblenza (República Federal de Alemania), el Centro Mundial de Datos de Escorrentía (GRDC), bajo los auspicios de la Organización Meteorológica Mundial (OMM).

El GRDC funciona para los Miembros de la OMM y la comunidad científica internacional. Constituye un mecanismo para el intercambio internacional de datos correspondientes a corrientes fluviales y escorrentía de agua de superficie de forma continua y a largo plazo. El GRDC recibe datos de numerosas fuentes, sobre todo a través de la OMM. Si bien se hace todo lo posible para lograr normas razonables de calidad de los datos y documentación conexa, la responsabilidad de los datos corresponde en última instancia a quienes las proporcionan y no al GRDC.

Los usuarios pueden disponer de todos los datos archivados en el GRDC mediante solicitud escrita o visita personal.

VI.1.2 Banco de datos

El banco de datos del GRDC constaba, en marzo de 1993, de escurrimientos para 3070 estaciones de 140 países. Se dispone de caudales diarios completos para 1834 estaciones y de escurrimientos mensuales para 1509 estaciones.

La parte esencial del banco de datos la constituyen los escurrimientos diarios para 1327 estaciones de 75 países, que se recopilaron inicialmente por el Departamento de Hidrología y Recursos Hídricos de la OMM, en el marco del Programa de Investigación de la Atmósfera Global (PIAG) OMM/CIUC, para utilizarlos en la validación de modelos de circulación general (MCG) de la atmósfera, y posteriormente del Programa Mundial sobre el Clima (PMC).

El primer año en que se dispuso de esta serie de datos fue en 1978, y casi todas las estaciones están completas hasta 1980. También se dispone de datos de 40 países hasta 1982-1983 y de Australia hasta 1984-1985. La base de datos se actualiza de vez en cuando.

Las estaciones se han elegido con arreglo a los siguientes criterios:

- distribución nacional uniforme (compatible con las condiciones de la red), con densidades más altas en zonas de rápida variación de caudal;
- cobertura, en la mayor medida posible, de cada tipo de región homogénea hidrológica de cada país;
- cuencas hidrográficas relativamente pequeñas (hasta unos 5.000 km² y, en casos excepcionales hasta 10.000 km²);
- datos que representan el escurrimiento natural de un río, es decir, que deben corregirse para derivaciones, abstracciones y redistribuciones por almacenamiento;
- registros de buena calidad.

VI.2 INFOCLIMA

VI.2.1 Introduction

The Climate Data Information Referral Service - INFOCLIMA - is a service for the collection and dissemination of information on the existence and availability of climate data in the world. The information comprises in particular:

- (a) descriptions of available data sets, held at data centres and/or published;
- (b) climatological and radiation station networks in the world, and their histories;
- (c) national climatological data banks - status of collection, processing and archiving of data.

The INFOCLIMA referral service is implemented by the WMO Secretariat under the World Climate Programme (WCP). Its development is guided by the general policies of the WCP and detailed working plans as contained in the Third WMO Long-Term Plan (1992-2001), Part II, Volume 2 (WMO No. 762; 1992).

INFOCLIMA information is obtained from Member countries of WMO and, as regards data sets, also from contributions by individual data centres and international organizations. The nature of the referral service is international; it has been developed in co-ordination with other international systems. **It should be emphasized that INFOCLIMA does not handle actual climate data but provides information on the existence and availability of climate data in the world.**

INFOCLIMA is maintained as a computerized data base. The information is published in different forms, depending on the nature of the information:

- Catalogue of Climate System Data Sets;
- Statistics on regional networks of climatological and radiation stations; in several volumes;
- Climatological data banks - regional status surveys.

VI.2.2 INFOCLIMA catalogue

The Catalogue contains descriptions of data sets which originate from a particular data collection or data processing programme. A single description may thus cover a number of "data sets" listed separately in inventories of data centres. The principle has been extended to cover an entire data inventory under one description where the various data sets all refer to a special research activity or a particular international scientific experiment.

Within the framework of the WCP, the data set references apply to data which are:

- (a) organized and, preferably, quality controlled;
- (b) considered to be of use in regional or global studies concerning climate;
- (c) available internationally (on conditions as indicated by the data centre).

INTERNATIONAL DATA BANKS

Methods of observations are not distinguished by separate categories. For instance, data sets derived from satellite and other remote sensing observations are described under the relevant subject categories.

VI.2.3 Structure of the catalogue

The catalogue is structured in four sections:

Section 1, concerns the arrangement of the catalogue and how to use it and contains, inter-alia, all the necessary codes.

Section 2, gives all the data centres included in the catalogue, listed according to WMO Region and country. For each centre the following information is provided:

- name and address
- terms of making available data sets
- title(s) of published catalogue(s) of data
- general description of data held by the centre

Section 3, deals with the data sets description. Data sets are arranged according to:

- data category
- area covered by the set

For each data category, data sets concerning global/regional areas and countries are shown in two different sub-sections.

Section 4, is the Index of data set titles arranged according to the same organization as for Section 3.

Tables V and VI from Section 1 enables **search of data sets**, starting from country (centre) for country sets and from region, for global/regional sets.

Section 3, enables search of data set description according to the following sequence:

- Data category
- Area covered by the data set
- Data set description and corresponding data centres.

A schematic lay out and examples for sections 2 and 3 from the hydrological data extract of the INFOCLIMA catalogue are shown here after.

One copy of the entire catalogue, April 1989 edition and March 1992 supplement or of the Hydrological data extract, October 1989 edition can be provided, **free of charge**, by the Secretariat upon request to:

The World Climate Data and Monitoring (WCDMP) Programme
World Meteorological Organization

BANQUE DE DONNÉES INTERNATIONALES

VI.2 INFOCLIMA

VI.2.1 Introduction

Le Service mondial d'information sur les données climatologiques - INFOCLIMA - est chargé de la collecte et de la diffusion des renseignements sur l'existence et la disponibilité dans le monde des données climatologiques. Cette information comprend notamment :

- a) descriptions des ensembles de données disponibles, se trouvant dans les centres de données et/ou faisant l'objet de publications;
- b) descriptions des réseaux de stations climatologiques et radiométriques existant dans le monde, accompagnées de l'historique de ces réseaux;
- c) banques de données climatologiques nationales - situation concernant la collecte, le traitement et l'archivage des données.

Le Service d'information INFOCLIMA est exploité par le Secrétariat de l'OMM dans le cadre du Programme climatologique mondial (PCM). Pour le développer, le Secrétariat suit les politiques générales du PCM et les plans de travail détaillés contenus dans le Volume 2 de la Partie II du troisième Plan à long terme de l'OMM (1992-2001) (OMM N° 762; 1992).

Les informations du service INFOCLIMA sont fournies par les pays Membres de l'OMM et, en ce qui concerne les ensembles de données, également par des contributions faites par des centres de données individuels ainsi que par des organisations internationales. Ce service d'information est par nature international puisqu'il a été mis au point en collaboration avec d'autres systèmes internationaux. **Il convient de souligner que le service INFOCLIMA ne traite pas à proprement parler de données climatologiques, mais fournit plutôt des informations sur l'existence et la disponibilité des données climatologiques dans le monde.**

INFOCLIMA fonctionne comme une base de données informatisée. L'information qu'il contient est publiée sous différentes formes, selon la nature de celle-ci :

- catalogue des ensembles de données de systèmes climatologiques;
- statistiques des réseaux régionaux des stations climatologiques et radiométriques, contenues dans plusieurs volumes;
- banques de données climatologiques - études régionales sur l'état de ces banques.

BANQUE DE DONNÉES INTERNATIONALES

Données maritimes et océaniques :

données fondées sur des observations météorologiques en surface effectuées dans des stations maritimes et/ou données fondées sur des observations de la surface des océans et des couches supérieures de la mer. Le cas échéant, un renvoi est ajouté à "données climatologiques de surface", précisant que ces ensembles de données se réfèrent à des zones côtières.

Données cryosphériques :

données concernant la cryosphère (terre et océans).

Données sur la composition de l'atmosphère :

données concernant la composition chimique et celle des particules de la troposphère et de la basse stratosphère, y compris les données concernant les polluants.

Données hydrologiques :

données concernant les eaux de surface et les eaux souterraines, les débits solides, le régime des glaces, des fleuves et des lacs, les sécheresses et les inondations. Lorsque des données sur la précipitation ou l'évaporation sont comprises dans un ensemble de données hydrologiques, un renvoi sera alors ajouté à "données climatologiques de surface".

Données anciennes et données indirectes :

données qui fournissent indirectement une indication sur le climat tel qu'il se présente actuellement, mais aussi tel qu'il se présentait par le passé et dans les temps anciens (par exemple, données tirées des renseignements disponibles concernant les inondations, la sédimentation, les dates des moissons, les cercles des troncs d'arbres, etc.), et également données sur les paléoclimats. Si un ensemble de données indiqué dans une autre catégorie porte sur des données ayant plus de cent ans d'âge, un renvoi sera alors ajouté à "données anciennes et données indirectes".

Les méthodes d'observations ne font pas l'objet de catégories distinctes. Par exemple, les ensembles de données tirées d'observations par satellite et autres moyens de télédétection sont décrits dans les catégories correspondant au type d'observation.

VI.2.3 Structure du catalogue

Le catalogue comprend quatre sections :

Section 1 : porte sur l'organisation du catalogue et son utilisation. Cette section contient notamment tous les codes nécessaires.

МЕЖДУНАРОДНЫЕ БАНКИ ДАННЫХ

VI.2 ИНФОКЛИМА

VI.2.1 Введение

Информационно-справочная служба климатических данных - ИНФОКЛИМА - является одной из служб по сбору и распространению информации о существующих и имеющихся в наличии климатических данных в мире. Информация, в частности, включает:

- a) описание имеющихся в наличии комплектов данных, хранящихся в центрах данных и/или опубликованных;
- b) сети климатологических и радиологических станций в мире и соответствующую о них информацию;
- c) национальные климатологические банки данных - состояние сбора, обработки и архивации данных.

Справочная служба ИНФОКЛИМА осуществляется Секретариатом ВМО в рамках Всемирной климатической программы (ВКП). Она развивается в соответствии с общей политикой ВКП и подробными рабочими планами, содержащимися в Третьем долгосрочном плане ВМО (1992-2001 гг.), часть II, том 2 (Публикация ВМО № 762; 1992 г.).

ИНФОКЛИМА получает информацию от стран-членов ВМО и, в том, что касается комплектов данных, также информацию, получаемую от индивидуальных центров данных и международных организаций. Справочная служба имеет международный характер; она создавалась в сотрудничестве с международными системами. Необходимо подчеркнуть, что ИНФОКЛИМА не занимается фактическими климатическими данными, а предоставляет информацию о существовании и наличии климатических данных в мире.

ИНФОКЛИМА представляет собой компьютеризированную базу данных. Информация публикуется в различных формах, в зависимости от ее характера:

- каталог комплектов данных климатической системы;
- статистические данные по региональным сетям климатологических и радиологических станций; в нескольких томах;
- банки климатологических данных - обзоры состояния на региональном уровне.

VI.2.2 Каталог ИНФОКЛИМА

Каталог содержит описание комплектов данных, которые формируются на основе конкретной совокупности данных или программы обработки данных. Общее описание может охватывать ряд "комплектов данных", перечисленных отдельно в каталогах центров данных. Этот принцип был использован для того, чтобы охватить в рамках одного описания весь каталог данных, где различные комплекты данных в целом относятся к конкретной научно-исследовательской деятельности или конкретному международному научному эксперименту.

МЕЖДУНАРОДНЫЕ БАНКИ ДАННЫХ

Гидрологические данные:

данные, касающиеся поверхностных и подземных вод, расхода наносов, ледового режима в реках и озерах, засух и наводков. В том случае, если в комплект гидрологических данных включены данные по осадкам/ испарению, то перекрестная ссылка вставляется в "приземные климатологические данные".

Исторические и косвенные данные:

данные, дающие косвенное представление о климате в настоящий, истекший и древний период (например, паводки, наносы, сроки сбора урожая, годовые кольца на срубах деревьев и т.д.), а также данные о палеоклимате. В том случае, если комплект данных другой категории содержит данные за более чем 100-летний период, то вставляется перекрестная ссылка в "исторические и косвенные данные".

Методы наблюдений не подразделяются на отдельные категории. Например, комплекты данных, полученные в результате наблюдений со спутников и других средств дистанционного зондирования, описаны в рамках соответствующих конкретных категорий.

VI.2.3 Структура каталога

Каталог состоит из четырех разделов:

Раздел 1 содержит информацию, касающуюся структуры каталога, порядка его использования и, в частности, все необходимые коды.

Раздел 2 содержит список всех центров данных, включенных в каталог, перечисленных по Регионам ВМО и странам. По каждому центру предоставляется следующая информация:

- название и адрес
- условия предоставления комплектов данных
- наименования опубликованных каталогов данных
- общее описание данных, которыми располагает центр.

Раздел 3 содержит описание комплектов данных. Комплекты данных сформированы соответственно из:

- категории данных
- охватываемой комплектом данных области.

Для каждой категории данных, комплекты данных, касающихся глобальных/региональных областей и стран, представлены в двух различных подразделах.

Раздел 4. В этом разделе содержится указатель наименований комплектов данных, составленный в том же порядке, что и раздел 3.

Таблица V и VI, содержащиеся в разделе 1, позволяют вести поиск комплектов данных начиная со стран (центров) для поиска комплектов данных по странам, до регионов для поиска комплектов глобальных/региональных данных.

Раздел 3 обеспечивает возможность поиска описания комплекта данных в следующем порядке:

- категория данных

VI.2 INFOCLIMA

VI.2.1 Introducción

El Servicio Mundial de Referencias e Información sobre Datos Climáticos - INFOCLIMA - es un servicio para la recopilación y difusión de información sobre la existencia y disponibilidad de datos climáticos en el mundo. La información comprende en particular:

- a) descripciones de series de datos disponibles, mantenidas en centros de datos y/o publicadas;
- b) redes de estaciones climatológicas y de radiación mundiales, y su historial;
- c) bancos de datos climatológicos nacionales: estado de recopilación, proceso y archivo de datos.

El Servicio de Referencia INFOCLIMA está a cargo de la Secretaría de la OMM en el marco del Programa Mundial sobre el Clima (PMC). Su desarrollo sigue las políticas generales del PMC y los planes de trabajo detallados contenidos en el Tercer Plan a Largo Plazo de la OMM (1992-2001), Parte II, Volumen 2 (OMM-Nº 762; 1992).

La información de INFOCLIMA se obtiene de los países Miembros de la OMM y, por lo que se refiere a las series de datos, también de contribuciones de distintos centros de datos y organizaciones internacionales. El servicio de referencia tiene carácter internacional; se ha desarrollado en coordinación con otros sistemas internacionales. **Procede destacar que el INFOCLIMA no trata datos reales sobre el clima, sino que proporciona información acerca de la disponibilidad de datos climáticos en el mundo.**

El INFOCLIMA se mantiene como base de datos computarizada. La información se publica en diferentes formas, según su naturaleza:

- catálogo de series de datos del sistema climático;
- estadísticas sobre redes regionales de estaciones climatológicas y de radiación, en varios volúmenes;
- bancos de datos climatológicos: estudios sobre la situación regional.

VI.2.2 Catálogo del INFOCLIMA

El Catálogo contiene descripciones de series de datos que proceden de una recopilación de datos particular o de un programa de proceso de datos. Una sola descripción puede abarcar, pues, varias "series de datos" enumeradas por separado en inventarios de centros de datos. El principio se ha ampliado para abarcar un inventario de datos completo bajo una descripción, cuando la totalidad de las diversas series de datos se refieren a una actividad de investigación especial o a un experimento científico internacional determinado.

En el marco del PMC, las referencias de las series de datos se aplican a datos:

- a) organizados y, preferentemente, de calidad controlada;
- b) que se considera se utilizan en estudios regionales o mundiales sobre el clima;
- c) de que se dispone internacionalmente (en las condiciones indicadas por el centro de datos).

Los métodos de observaciones no se distinguen por categorías separadas. Por ejemplo, las series de datos derivadas de observaciones por satélite y otras observaciones por teledetección se describen en las categorías pertinentes.

VI.2.3 Estructura del catálogo

El catálogo se divide en cuatro secciones:

La **Sección 1** concierne la disposición del catálogo y a la manera de utilizarlo, y contiene, entre otras cosas, todas las claves necesarias.

La **Sección 2** contiene todos los centros de datos incluidos en el catálogo, enumerados por Regiones de la OMM y países. Para cada centro se proporciona la siguiente información:

- nombre y dirección;
- condiciones en que se ponen a disposición las series de datos;
- título(s) de catálogo(s) publicado(s) de datos;
- descripción general de datos mantenidos por el centro.

La **Sección 3** trata de la descripción de las series de datos. Las series de datos se disponen con arreglo a:

- la categoría de datos;
- la zona abarcada por la serie.

Para cada categoría de datos, las series de datos referentes a zonas mundiales/regionales y países se muestran en dos subsecciones distintas.

La **Sección 4** es el índice de títulos de series de datos dispuestos con arreglo a la misma organización que para la Sección 3.

Los Cuadros V y VI de la Sección 1 permiten la **búsqueda de series de datos**, a partir de un país (centro) para las series de países, y a partir de una región para las series mundiales/regionales.

La Sección 3 permite la búsqueda de la descripción de series de datos con arreglo al siguiente orden:

- categoría de los datos;
- zona abarcada por la serie de datos;
- descripción de la serie de datos y centros de datos correspondientes.

A continuación se muestran una presentación esquemática y ejemplos de las Secciones 2 y 3 del extracto de datos hidrológicos del catálogo INFOCLIMA.

La Secretaría puede proporcionar gratuitamente un ejemplar de todo el catálogo, edición de abril de 1989 y del suplemento de marzo de 1992 o del extracto de datos hidrológicos, edición de octubre de 1989, a quienes lo soliciten a la siguiente dirección:

Region: 4

406 - CANADA

<u>406B CENTRE</u>	: Aquatic Ecology Division, Canada Centre for Inland Waters National Water Research Institute P.O. Box 5050 Burlington, Ontario L7R 4A6 Canada
TELEPHONE:	(416) 336-4788
TERMS	: By negotiation.
DATA HELD:	Paleoclimatic data primarily from Holocene sediments of Canadian prairies.
<u>406F CENTRE</u>	: Northern Forestry Centre, Edmonton - Canada 5320-122 Street, Edmonton Alberta Canada T6H 3S5
TELEPHONE:	(403) 435-7210
TERMS	: Copies of summarized data available on request.
PUBLISHED:	Alberta Naturalist Vols 7-16 (Annual Supplement up to Vol.14) Compilation of Hydrometeorological Record: Marmot Creek Basin (1967-1982).
DATA HELD:	Results of annual survey of plants in flower on the last weekend in May in Alberta, Canada; annual totals, year to year and area to area comparisons included. Meteorological snow survey and radiation data. Tree-ring data.
<u>406H CENTRE</u>	: Water Survey of Canada, Water Resources Branch, Environment Canada Ottawa Ontario K1A 0H3 Canada
TELEPHONE:	819-997-1474
TERMS	: No charge; agreement that any reports based in whole or in part on these data should acknowledge the Water Survey of Canada as their source.
PUBLISHED:	Surface Water Data; Reference Index; Canada; 1986. Sediment Data; Reference Index; Canada; 1984.
DATA HELD:	No. stations: active discontinued
river discharges	2666 3062
river/lake water levels	773 995
sediment discharge	185 492
water temperatures	28 16

420 - COSTA RICA

<u>420B CENTRE</u>	: Instituto Costarricense de Electricidad - Costa Rica Departamento de Estudios Básicos Apartado 10032 San José 1000 Costa Rica
TELEPHONE:	20-73-09 or 20-75-31
PUBLISHED:	Boletines Hidrológicos (16 publications). Boletín de Sedimentos (1 publication). Boletín de Calidad Físico-Química del Agua (1 publication).
DATA HELD:	Processed data include discharge, precipitation, temperature, humidity, evaporation, sediment and quality of water. All processed data are kept as a computerized data bank (computerized lists available).

430 - JAMAICA

<u>430B CENTRE</u>	: Jamaica Office of Disaster Preparedness & Emergency Relief Co-ordination 2a Devon Road Kingston 10 Jamaica West Indies
TELEPHONE:	94400-4
TERMS	: On request; occasionally cost of mailing only is charged.
DATA HELD:	Occurrence of disasters in the country including: casualties economic losses damages to the country's infrastructure.
